# Table of Contents

|           |   |           |
|-----------|---|-----------|
| <b>1</b>  | <b>Overview .....</b>   | <b>19</b> |
| 1.1       | Intended Audience .....   | 19        |
| 1.2       | Reference Documents .....   | 19        |
| 1.3       | Conventions .....   | 19        |
| 1.3.1     | Numbering .....   | 19        |
| 1.3.2     | Arithmetic And Logical Operators .....                              | 20        |
| 1.4       | Definitions .....   | 21        |
| 1.5       | Changes Between Revisions and Product Variations .....              | 26        |
| 1.5.1     | Revision Conventions .....  | 26        |
| 1.5.2     | Major Changes Relative to Family 10h Revision D Processors .....    | 27        |
| 1.5.2.1   | Major Changes to Performance Counters Relative to Fam10h RevD ..... | 31        |
| <b>2</b>  | <b>Functional Description .....</b>                                 | <b>33</b> |
| 2.1       | Processor Overview .....  | 33        |
| 2.2       | System Overview .....   | 34        |
| 2.3       | Processor Initialization .....                                      | 35        |
| 2.3.1     | BSP initialization .....  | 35        |
| 2.3.2     | AP initialization .....   | 36        |
| 2.3.3     | Using L2 Cache as General Storage During Boot .....                 | 36        |
| 2.3.3.1   | Using L2 Cache as General Storage During Boot .....                 | 38        |
| 2.3.4     | Multiprocessing Capability Detection .....                          | 38        |
| 2.3.5     | SLIT and SRAT .....   | 38        |
| 2.3.5.1   | SLIT .....  | 39        |
| 2.3.5.2   | SRAT .....  | 40        |
| 2.4       | Processor Core .....  | 40        |
| 2.4.1     | Compute Unit .....  | 40        |
| 2.4.1.1   | Registers Shared by Cores in a Compute Unit .....                   | 40        |
| 2.4.2     | Virtual Address Space .....   | 42        |
| 2.4.3     | Processor Cores and Downcoring .....                                | 42        |
| 2.4.3.1   | Software Downcoring using D18F3x190[DisCore] .....                  | 42        |
| 2.4.4     | Physical Address Space .....  | 43        |
| 2.4.5     | System Address Map .....  | 43        |
| 2.4.5.1   | Memory Access to the Physical Address Space .....                   | 43        |
| 2.4.5.1.1 | Determining Memory Type .....                                       | 43        |
| 2.4.5.1.2 | Determining The Access Destination for Core Accesses .....          | 44        |
| 2.4.6     | Timers .....  | 44        |
| 2.4.7     | Implicit Conditions for TLB Invalidation .....                      | 44        |
| 2.4.8     | Interrupts .....  | 45        |
| 2.4.8.1   | Local APIC .....  | 45        |
| 2.4.8.1.1 | Detecting and Enabling .....  | 45        |
| 2.4.8.1.2 | APIC Register Space .....   | 45        |
| 2.4.8.1.3 | ApicId Enumeration Requirements .....                               | 45        |
| 2.4.8.1.4 | Physical Destination Mode .....                                     | 46        |
| 2.4.8.1.5 | Logical Destination Mode .....                                      | 46        |
| 2.4.8.1.6 | Interrupt Delivery .....  | 47        |
| 2.4.8.1.7 | Vectored Interrupt Handling .....                                   | 47        |
| 2.4.8.1.8 | Interrupt Masking .....   | 47        |
| 2.4.8.1.9 | Spurious Interrupts .....   | 47        |

|             |   |    |
|-------------|---|----|
| 2.4.8.1.10  | Spurious Interrupts Caused by Timer Tick Interrupt                | 47 |
| 2.4.8.1.11  | Lowest-Priority Interrupt Arbitration                             | 48 |
| 2.4.8.1.12  | Inter-Processor Interrupts  | 48 |
| 2.4.8.1.13  | APIC Timer Operation  | 48 |
| 2.4.8.1.14  | Generalized Local Vector Table                                    | 49 |
| 2.4.8.1.15  | State at Reset  | 49 |
| 2.4.8.2     | System Management Mode (SMM)                                      | 49 |
| 2.4.8.2.1   | SMM Overview  | 49 |
| 2.4.8.2.2   | Operating Mode and Default Register Values                        | 49 |
| 2.4.8.2.3   | SMI Sources And Delivery  | 50 |
| 2.4.8.2.4   | SMM Initial State   | 50 |
| 2.4.8.2.5   | SMM Save State  | 51 |
| 2.4.8.2.6   | Exceptions and Interrupts in SMM                                  | 56 |
| 2.4.8.2.7   | The Protected ASeg and TSeg Areas                                 | 57 |
| 2.4.8.2.8   | SMM Special Cycles  | 57 |
| 2.4.8.2.9   | Locking SMM   | 57 |
| 2.4.8.2.10  | Synchronizing SMM Entry (Spring-Boarding)                         | 57 |
| 2.4.9       | Secure Virtual Machine Mode (SVM)                                 | 59 |
| 2.4.9.1     | BIOS support for SVM Disable                                      | 59 |
| 2.4.10      | CPUID Instruction   | 59 |
| 2.4.10.1    | Multi-Core Support  | 59 |
| 2.4.10.2    | L3 Cache Support  | 59 |
| 2.5         | Power Management  | 60 |
| 2.5.1       | Processor Power Planes And Voltage Control                        | 60 |
| 2.5.1.1     | Internal VID Registers  | 60 |
| 2.5.1.1.1   | VID Encodings   | 61 |
| 2.5.1.1.2   | MinVid and MaxVid Check   | 61 |
| 2.5.1.2     | Serial VID Interface  | 61 |
| 2.5.1.3     | BIOS Requirements for Power Plane Initialization                  | 61 |
| 2.5.1.4     | Low Power Features  | 61 |
| 2.5.1.4.1   | PSI_L Bit   | 61 |
| 2.5.1.5     | Voltage Transitions   | 62 |
| 2.5.1.5.1   | Hardware-Initiated Voltage Transitions                            | 62 |
| 2.5.1.5.2   | Software-Initiated Voltage Transitions                            | 62 |
| 2.5.1.5.2.1 | Software-Initiated NB Voltage Transitions                         | 63 |
| 2.5.1.5.2.2 | Software-Initiated Core Voltage Transitions                       | 63 |
| 2.5.2       | P-states  | 63 |
| 2.5.2.1     | Core P-states   | 63 |
| 2.5.2.1.1   | Application Power Management (APM)                                | 64 |
| 2.5.2.1.1.1 | TDP Limiting  | 64 |
| 2.5.2.1.1.2 | Notification of TDP Limit Changes                                 | 65 |
| 2.5.2.1.2   | Core P-state Naming and Numbering                                 | 66 |
| 2.5.2.1.2.1 | Software P-state Numbering  | 66 |
| 2.5.2.1.2.2 | Hardware P-state Numbering  | 66 |
| 2.5.2.1.3   | Core P-state Control  | 67 |
| 2.5.2.1.4   | Core P-state Visibility   | 67 |
| 2.5.2.1.5   | Core P-state Limits   | 68 |
| 2.5.2.1.6   | Core P-state Bandwidth Requirements                               | 68 |
| 2.5.2.1.7   | Core P-state Transition Behavior                                  | 68 |
| 2.5.2.1.8   | BIOS Requirements for Core P-state Initialization and Transitions | 69 |
| 2.5.2.1.9   | Processor-Systemboard Power Delivery Compatibility Check          | 69 |

|              |   |    |
|--------------|---|----|
| 2.5.2.1.10   | BIOS COF and VID Requirements After Warm Reset            | 71 |
| 2.5.2.1.10.1 | Core Maximum P-state Transition Sequence After Warm Reset | 71 |
| 2.5.2.1.10.2 | Core Minimum P-state Transition Sequence After Warm Reset | 71 |
| 2.5.2.1.10.3 | NB COF and VID Transition Sequence After Warm Reset       | 72 |
| 2.5.2.1.11   | ACPI Processor P-state Objects                            | 72 |
| 2.5.2.1.11.1 | _PCT (Performance Control)                                | 73 |
| 2.5.2.1.11.2 | _PSS (Performance Supported States)                       | 73 |
| 2.5.2.1.11.3 | _PPC (Performance Present Capabilities)                   | 73 |
| 2.5.2.1.11.4 | _PSD (P-state Dependency)                                 | 74 |
| 2.5.2.1.12   | XPSS (Microsoft® Extended PSS) Object                     | 74 |
| 2.5.2.2      | NB P-states   | 74 |
| 2.5.2.2.1    | NB P-state Control  | 74 |
| 2.5.2.3      | Mixed Frequency and Power P-state Configuration           | 75 |
| 2.5.2.3.1    | Mixed Northbridge Frequency Configuration Sequence        | 75 |
| 2.5.2.3.2    | Mixed Power P-State Configuration Sequence                | 76 |
| 2.5.2.3.3    | Mixed Frequency and Power P-State Configuration Rules     | 76 |
| 2.5.2.3.4    | Mixed Frequency and Power P-State Configuration Sequence  | 77 |
| 2.5.3        | C-states  | 82 |
| 2.5.3.1      | C-state Names and Numbers                                 | 82 |
| 2.5.3.2      | C-state Request Interface                                 | 82 |
| 2.5.3.3      | C-state Actions   | 82 |
| 2.5.3.3.1    | C-state Divisors and Probes                               | 82 |
| 2.5.3.3.2    | C-state Cache Flush                                       | 83 |
| 2.5.3.3.3    | Core C6 (CC6) State                                       | 83 |
| 2.5.3.4      | Exiting C-states  | 84 |
| 2.5.3.5      | C1 Enhanced State (C1E)                                   | 84 |
| 2.5.3.5.1    | Message Triggered C1E                                     | 85 |
| 2.5.3.5.2    | BIOS Requirements to Initialize Message Triggered C1E     | 85 |
| 2.5.3.6      | ACPI Processor C-state Objects                            | 85 |
| 2.5.3.6.1    | _CST  | 85 |
| 2.5.3.6.2    | _CSD  | 86 |
| 2.5.3.6.3    | _CRS  | 86 |
| 2.5.3.6.4    | Fixed ACPI Description Table (FADT) Entries               | 86 |
| 2.5.3.7      | BIOS Requirements for Initialization                      | 86 |
| 2.5.4        | Frequency and Voltage Domain Dependencies                 | 86 |
| 2.5.4.1      | Dependencies Between Cores in a Compute Unit              | 86 |
| 2.5.5        | S-states  | 87 |
| 2.5.5.1      | ACPI Suspend to RAM State (S3)                            | 87 |
| 2.5.6        | Effective Frequency Interface                             | 87 |
| 2.6          | Processor State Transition Sequences                      | 88 |
| 2.6.1        | ACPI Power State Transitions                              | 88 |
| 2.7          | Performance Monitoring                                    | 88 |
| 2.7.1        | Core Performance Monitor Counters                         | 89 |
| 2.7.2        | NB Performance Monitor Counters                           | 90 |
| 2.7.3        | Instruction Based Sampling (IBS)                          | 91 |
| 2.8          | Configuration Space                                       | 91 |
| 2.8.1        | MMIO Configuration Coding Requirements                    | 92 |
| 2.8.2        | MMIO Configuration Ordering                               | 92 |
| 2.8.3        | Processor Configuration Space                             | 92 |
| 2.9          | Northbridge (NB)  | 93 |
| 2.9.1        | NB Architecture   | 93 |

|              |   |     |
|--------------|---|-----|
| 2.9.2        | GART  | 93  |
| 2.9.3        | NB Routing  | 94  |
| 2.9.3.1      | Address Space Routing                                       | 94  |
| 2.9.3.1.1    | DRAM and MMIO Memory Space                                  | 94  |
| 2.9.3.1.2    | IO Space  | 95  |
| 2.9.3.1.3    | Configuration Space   | 95  |
| 2.9.3.2      | HyperTransport™ Technology Routing                          | 95  |
| 2.9.3.2.1    | Routing Table Configuration                                 | 97  |
| 2.9.3.2.2    | NodeId Enumeration Requirements for Dual-node Processors    | 98  |
| 2.9.3.2.3    | BIOS Requirements for Systems with Mixed Processor Families | 98  |
| 2.9.3.2.4    | Link Traffic Distribution                                   | 98  |
| 2.9.3.2.4.1  | Coherent Link Traffic Distribution                          | 99  |
| 2.9.3.2.4.2  | Coherent Link Pair Traffic Distribution                     | 99  |
| 2.9.3.2.4.3  | Victim Distribution Mode                                    | 99  |
| 2.9.3.2.5    | Display Refresh And IFCM                                    | 100 |
| 2.9.3.2.5.1  | Recommended Buffer Count Settings Overview                  | 101 |
| 2.9.4        | The Level 3 Cache (L3)                                      | 102 |
| 2.9.4.1      | Probe Filter  | 102 |
| 2.9.4.1.1    | Probe Filter Errors   | 103 |
| 2.9.4.2      | Probe Filter and ATM Mode Initialization Sequence           | 103 |
| 2.9.4.3      | L3 Cache Partitioning                                       | 104 |
| 2.9.5        | Memory Scrubbers  | 104 |
| 2.10         | DRAM Controllers (DCTs)                                     | 104 |
| 2.10.1       | DCT Configuration Registers                                 | 111 |
| 2.10.2       | DDR Pad to Processor Pin Mapping                            | 111 |
| 2.10.3       | DRAM Controller Direct Response Mode                        | 113 |
| 2.10.4       | DRAM Data Burst Mapping                                     | 113 |
| 2.10.5       | DCT/DRAM Initialization and Resume                          | 113 |
| 2.10.5.1     | Low Voltage DDR3  | 114 |
| 2.10.5.2     | NB P-state Specific Configuration                           | 114 |

# List of Tables

|           |  |     |
|-----------|--|-----|
| Table 1:  | Arithmetic and Logical Operators.....                              | 20  |
| Table 2:  | Functions.....   | 20  |
| Table 3:  | Definitions.....   | 21  |
| Table 4:  | Processor revision conventions.....                                | 27  |
| Table 5:  | SLIT Table Without Probe Filter .....                              | 39  |
| Table 6:  | SLIT Table With Probe Filter.....                                  | 39  |
| Table 7:  | Compute Unit Definitions.....                                      | 40  |
| Table 8:  | SharedC and SharedNC MSR's .....                                   | 41  |
| Table 9:  | SMM Initial State.....   | 50  |
| Table 10: | SMM Save State.....  | 51  |
| Table 11: | Power Management Support.....                                      | 60  |
| Table 12: | Software P-state Naming .....                                      | 66  |
| Table 13: | Software P-state Control .....                                     | 67  |
| Table 14: | Representative mixed frequency P-state table example (step 2)..... | 77  |
| Table 15: | Representative mixed frequency P-state table example (step 3)..... | 78  |
| Table 16: | Representative mixed frequency P-state table example (step 4)..... | 79  |
| Table 17: | Representative mixed frequency P-state table example (step 6)..... | 79  |
| Table 18: | Representative mixed frequency P-state table example (step 7)..... | 80  |
| Table 19: | Representative mixed frequency P-state table example (final).....  | 81  |
| Table 20: | Representative mixed frequency _PSS object example.....            | 81  |
| Table 21: | Dependencies Between Cores in a Compute Unit .....                 | 87  |
| Table 22: | Core PMC mapping to PERF_CTL[5:0] .....                            | 89  |
| Table 23: | Link Definitions .....   | 101 |
| Table 24: | L3 Controller Definitions.....                                     | 102 |
| Table 25: | DCT Definitions.....   | 105 |
| Table 26: | DDR3 UDIMM Maximum Frequency Support for G34 .....                 | 106 |
| Table 27: | DDR3 RDIMM Maximum Frequency Support for G34 .....                 | 107 |
| Table 28: | DDR3 LRDIMM Maximum Frequency Support for G34.....                 | 107 |
| Table 29: | DDR3 UDIMM Maximum Frequency Support for C32 .....                 | 108 |
| Table 30: | DDR3 RDIMM Maximum Frequency Support for C32.....                  | 108 |
| Table 31: | DDR3 LRDIMM Maximum Frequency Support for C32 .....                | 109 |
| Table 32: | DDR3 UDIMM Maximum Frequency Support for AM3r2 .....               | 110 |
| Table 33: | DDR3 UDIMM Population Support G34/C32 .....                        | 110 |
| Table 34: | DDR3 RDIMM Population Support G34/C32.....                         | 111 |
| Table 35: | DDR3 LRDIMM Population Support G34/C32 .....                       | 111 |
| Table 36: | DDR3 UDIMM Population Support AM3r2 .....                          | 111 |
| Table 37: | Package pin mapping .....  | 112 |
| Table 38: | Phy Predriver Calibration Codes for Data/DQS at 1.5V .....         | 118 |
| Table 39: | Phy Predriver Calibration Codes for Data/DQS at 1.35V .....        | 118 |

# Revision History

## Revision 3.04 Changes

- [2.5.2.1.6 \[Core P-state Bandwidth Requirements\]](#): Updated rule: (core COF / NB COF)  $\leq$  4.
- [2.5.2.1.9 \[Processor-Systemboard Power Delivery Compatibility Check\]](#): Updated.
- [2.10.5.3.4 \[Phy Compensation Initialization\]](#), [2.10.5.8.4 \[DQS Position Training\]](#): Updated.
- [MSRC001\\_1022](#)[DisPfhWForSw]: Added.
- [MSRC001\\_1029](#)[ConvertPrefetchToNop]: Added.
- [MSRC001\\_102B](#)[PfcDis, PfcStrideDis, PfcRegionDis, PfcL1TrainDis]: Added.

## Revision 3.02 Changes

- [1.5.1 \[Revision Conventions\]](#): Updated.

## Revision 3.00 Changes

- Initial public release.

## 1 Overview

This document defines AMD Family 15h Models 00h-0Fh Processors, henceforth referred to as the processor.

- The processor overview is located at [2.1 \[Processor Overview\]](#).
- The processors is distinguished by the combined ExtFamily and BaseFamily fields of the CPUID instruction (see [CPUID Fn8000\\_0001\\_EAX](#) in [3.10 \[CPUID Instruction Registers\]](#)).

### 1.1 Intended Audience

This document provides the processor behavioral definition and associated design notes. It is intended for platform designers and for programmers involved in the development of low-level BIOS (basic input/output system) functions, drivers, and operating system kernel modules. It assumes prior experience in personal computer platform design, microprocessor programming, and legacy x86 and AMD64 microprocessor architecture. The reader should also have familiarity with various platform technologies, such as DDR DRAM.

### 1.3 Conventions

#### 1.3.1 Numbering

- **Binary numbers.** Binary numbers are indicated by appending a “b” at the end, e.g., 0110b.
- **Decimal numbers.** Unless specified otherwise, all numbers are decimal. This rule does not apply to the register mnemonics described in [3.1 \[Register Descriptions and Mnemonics\]](#); register mnemonics all utilize hexadecimal numbering.
- **Hexadecimal numbers.** hexadecimal numbers are indicated by appending an “h” to the end, e.g., 45f8h.
- **Underscores in numbers.** Underscores are used to break up numbers to make them more readable. They do not imply any operation. E.g., 0110\_1100b.

### 1.3.2 Arithmetic And Logical Operators

In this document, formulas follow some Verilog conventions for logic equations.

**Table 1: Arithmetic and Logical Operators**

| Operator | Definition   |
|----------|--|
| {}       | Curly brackets are used to indicate a group of bits that are concatenated together. Each set of bits is separated by a comma. E.g., {Addr[3:2], Xlate[3:0]} represents a 6-bit value; the two MSBs are Addr[3:2] and the four LSBs are Xlate[3:0]. |
|          | Bitwise OR operator. E.g. (01b   10b == 11b).  |
|          | Logical OR operator. E.g. (01b    10b == 1b); treats multibit operand as 1 if >=1 and produces a 1-bit result.   |
| &        | Bitwise AND operator. E.g. (01b & 10b == 00b).   |
| &&       | Logical AND operator. E.g. (01b && 10b == 1b); treats multibit operand as 1 if >=1 and produces a 1-bit result.  |
| ^        | Bitwise exclusive-OR operator. E.g. (01b ^ 10b == 11b). Sometimes used as “raised to the power of” as well, as indicated by the context in which it is used. E.g. (2^2 == 4).  |
| ~        | Bitwise NOT operator (also known as ones complement). E.g. (~10b == 01b).  |
| !        | Logical NOT operator. E.g. (!10b == 0b); treats multibit operand as 1 if >=1 and produces a 1-bit result.  |
| ==       | Logical “is equal to” operator.  |
| !=       | Logical “is not equal to” operator.  |
| <=       | Less than or equal operator.   |
| >=       | Greater than or equal operator.  |
| *        | Arithmetic multiplication operator.  |
| /        | Arithmetic division operator.  |
| <<       | Shift left first operand by the number of bits specified by the 2nd operand. E.g. (01b << 01b == 10b).   |
| >>       | Shift right first operand by the number of bits specified by the 2nd operand. E.g. (10b >> 01b == 01b).  |
| ?        | Conditional/ternary operator. E.g. condition? value-if-true: value-if-false. Equivalent to IF condition THEN value-if-true ELSE value-if-false.  |

**Table 2: Functions**

| Function | Definition   |
|----------|--|
| ABS      | ABS(integer-expression): Remove sign from signed value.                                    |
| FLOOR    | FLOOR(integer-expression): Rounds real number down to nearest integer.                     |
| CEIL     | CEIL(real-expression): Rounds real number up to nearest integer.                           |
| MIN      | MIN(integer-expression-list): Picks minimum integer or real value of comma separated list. |
| MAX      | MAX(integer-expression-list): Picks maximum integer or real value of comma separated list. |
| COUNT    | COUNT(integer-expression): Returns the number of binary 1’s in the integer.                |

**Table 2: Functions**

| Function | Definition  |
|----------|---|
| ROUND    | ROUND(real-expression): Rounds to the nearest integer; halfway rounds away from zero.   |
| UNIT     | UNIT(fieldName UnitOfMeasure): Input operand is a register field name that defines all values with the same unit of measure. Returns the value expressed in the unit of measure for the current value of the register field. E.g. If (D18F2x210_dct[1:0]_nbp[3:0][RdPtrInit]==0101b) then (UNIT(D18F2x210_dct[1:0]_nbp[3:0][RdPtrInit] MEMCLK)==1.5). |
| POW      | POW(base, exponent): POW(x,y) returns the value x to the power of y.  |

The order in which logical operators are applied is: ~ first, & second, and | last.

For example, the equation:

Output[3:0] = {A[1:0], B[3:2]} & C[3:0] | ~D[3:0] & E[9:6],

is translated as:

Output[3] = (A[1] & C[3]) | (~D[3] & E[9]);

Output[2] = (A[0] & C[2]) | (~D[2] & E[8]);

Output[1] = (B[3] & C[1]) | (~D[1] & E[7]);

Output[0] = (B[2] & C[0]) | (~D[0] & E[6]);

## 1.4 Definitions

**Table 3: Definitions**

| Term            | Definition   |
|-----------------|--|
| <b>AP</b>       | Application processor. See <a href="#">2.3 [Processor Initialization]</a> .  |
| <b>APM</b>      | Application Power Management. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> .   |
| <b>ATM</b>      | ATM: Accelerated Transition to Modified. See <a href="#">D18F0x68[ATMModeEn]</a> .   |
| <b>APML</b>     | Advanced Platform Management Link. See <a href="#">2.13.4 [Sideband Interface (SBI)]</a> .   |
| <b>B</b>        | Byte.  |
| <b>BCS</b>      | Base configuration space. See <a href="#">2.8 [Configuration Space]</a> .  |
| <b>BERT</b>     | Bit error rate tester. A piece of test equipment that generates arbitrary test patterns and checks that a device under test returns them without errors.   |
| <b>BIST</b>     | Built-in self-test. Hardware within the processor that generates test patterns and verifies that they are stored correctly (in the case of memories) or received without error (in the case of links).                       |
| <b>Boot VID</b> | Boot voltage ID. This is the VDD and VDDNB voltage level that the processor requests from the external voltage regulator during the initial phase of the cold boot sequence. See <a href="#">2.5.1.1.1 [VID Encodings]</a> . |
| <b>BSC</b>      | Boot strap core. Core 0 of the <a href="#">BSP</a> . Specified by <a href="#">MSR0000_001B[BSC]</a> .  |
| <b>BSP</b>      | Boot strap processor. See <a href="#">2.3 [Processor Initialization]</a> .   |
| <b>CAR</b>      | Use of the L2 cache as RAM during boot. See <a href="#">2.3.3 [Using L2 Cache as General Storage During Boot]</a> .  |
| <b>C-states</b> | These are ACPI-defined core power states. C0 is operational. All other C-states are low-power states in which the processor is not executing code. See <a href="#">2.5.3 [C-states]</a> .                                    |

**Table 3: Definitions**

| <b>Term</b>                      | <b>Definition</b>  |
|----------------------------------|--|
| <b>C1E</b>                       | C1 enhanced state. Power-savings mode that is employed when all cores of a CMP processor are in the Halt state. See <a href="#">MSRC001_0055 [Interrupt Pending]</a> .   |
| <b>Canonical address</b>         | An address in which the state of the most-significant implemented bit is duplicated in all the remaining higher-order bits, up to bit 63.  |
| <b>Channel</b>                   | See DRAM channel.  |
| <b>Channel interleaved mode</b>  | Mode in which DRAM address space is interleaved between DRAM channels. See <a href="#">2.10.6 [Memory Interleaving Modes]</a> .  |
| <b>Chipkill ECC</b>              | An error correcting code which can recover from DRAM device failures. See <a href="#">2.13.2 [DRAM Considerations for ECC]</a> .   |
| <b>CMP</b>                       | Chip multi-processing. Refers to processors that include multiple cores. See <a href="#">2.1 [Processor Overview]</a> .  |
| <b>Coherent fabric</b>           | The coherent fabric is defined to include the memory and caches for each node and the coherent communication between all nodes. See <a href="#">2.2 [System Overview]</a> .                                      |
| <b>Coherent link or coh link</b> | A link configured for coherent inter-processor traffic between nodes.  |
| <b>COF</b>                       | Current operating frequency of a given clock domain. See <a href="#">2.5.2 [P-states]</a> .  |
| <b>Cold reset</b>                | PWROK is deasserted and RESET_L is asserted. See <a href="#">2.3 [Processor Initialization]</a> .  |
| <b>Compute Unit</b>              | Two <a href="#">Cores</a> that share IC, DE, FP and L2 resources. See <a href="#">2.1 [Processor Overview]</a> .   |
| <b>Core</b>                      | The instruction execution unit of the processor. See <a href="#">2.1 [Processor Overview]</a> .  |
| <b>CPB</b>                       | Core performance boost. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> .   |
| <b>CpuCore-Num</b>               | Specifies the core number. See <a href="#">2.4.3 [Processor Cores and Downcoring]</a> .  |
| <b>CPUID function X</b>          | Refers to the CPUID instruction when EAX is preloaded with X. See <a href="#">3.10 [CPUID Instruction Registers]</a> .   |
| <b>CS</b>                        | Chip select. See <a href="#">D18F2x[5C:40]_dct[1:0] [DRAM CS Base Address]</a> .   |
| <b>DCT</b>                       | DRAM controller. See <a href="#">2.10 [DRAM Controllers (DCTs)]</a> .  |
| <b>DCQ</b>                       | DRAM controller queue.   |
| <b>DDR3</b>                      | DDR3 memory technology. See <a href="#">2.10 [DRAM Controllers (DCTs)]</a> .   |
| <b>DFE</b>                       | Decision feedback equalization. See <a href="#">D18F4x1[9C,94,8C,84]_x[D4,C4] [Link Phy DFE and DFR Control]</a> .   |
| <b>DID</b>                       | Divisor identifier. Specifies the post-PLL divisor used to reduce the COF. See <a href="#">2.5.2 [P-states]</a> .  |
| <b>Display refresh</b>           | Traffic used for display refresh in UMA systems. See <a href="#">2.9.3.2.5 [Display Refresh And IFCM]</a> .  |
| <b>Doubleword</b>                | A 32-bit value.  |
| <b>Downcoring</b>                | Removal of cores. See <a href="#">2.4.3 [Processor Cores and Downcoring]</a> .   |
| <b>DRAM channel</b>              | The part of the DRAM interface that connects to a 64-bit DIMM. For example, a processor with a 128-bit DRAM interface is said to support two DRAM channels. See <a href="#">2.10 [DRAM Controllers (DCTs)]</a> . |

**Table 3: Definitions**

| Term                            | Definition   |
|---------------------------------|--|
| <b>Dual-Plane</b>               | Refers to a processor or systemboard where VDD and VDDNB are separate and may operate at independent voltage levels. Refer to 2.5.1 [Processor Power Planes And Voltage Control].  |
| <b>DW</b>                       | Doubleword. A 32-bit value.  |
| <b>ECS</b>                      | Extended configuration space. See 2.8 [Configuration Space].   |
| <b>EDS</b>                      | Electrical data sheet. See 1.2 [Reference Documents].  |
| <b>FDS</b>                      | Functional data sheet; there is one FDS for each package type.   |
| <b>FID</b>                      | Frequency identifier. Specifies the PLL frequency multiplier for a given clock domain. See 2.5.2 [P-states].   |
| <b>GB</b>                       | Gbyte or Gigabyte; 1,073,741,824 bytes.  |
| <b>#GP</b>                      | A general-protection exception. Always produces an error code of 0. #GP(0)   |
| <b>GT/s</b>                     | Giga-transfers per second.   |
| <b>HTC</b>                      | Hardware thermal control. See 2.11.2.1 [PROCHOT_L and Hardware Thermal Control (HTC)].   |
| <b>HTC-active state</b>         | Hardware-controlled lower-power, lower-performance state used to reduce temperature. See 2.11.2.1 [PROCHOT_L and Hardware Thermal Control (HTC)].  |
| <b>IBS</b>                      | Instruction based sampling. See 2.7 [Performance Monitoring].  |
| <b>IFCM</b>                     | Isochronous flow-control mode, as defined in the link specification. See 2.9.3.2.5 [Display Refresh And IFCM].   |
| <b>ILM</b>                      | Internal loopback mode. Mode in which the link receive lanes are connected directly to the transmit lanes of the same link for testing and characterization. See D18F0x[18C:170] [Link Extended Control].                                      |
| <b>Inactive lane</b>            | The inactive lanes of a link are lanes between the operating width as specified by D18F0x[E4,C4,A4,84][WidthOut, WidthIn] and the maximum link width as specified by D18F0x[E4,C4,A4,84][MaxWidthOut, MaxWidthIn]. See the link specification. |
| <b>IO configuration</b>         | Access to configuration space through IO ports CF8h and CFCh. See 2.8 [Configuration Space].   |
| <b>IO hub</b>                   | The platform device that contains the bridge to the system BIOS.   |
| <b>IO link</b>                  | A link configured for non-coherent traffic, per the link specification.  |
| <b>IORR</b>                     | IO range register. See MSRC001_00[18,16] [IO Range Base (IORR_BASE[1:0])].   |
| <b>KB</b>                       | Kbyte or Kilobyte; 1024 bytes.   |
| <b>L1 cache</b>                 | The level 1 caches (instruction cache and the data cache), the level 2 caches, and level 3 cache of the core. See 2.1 [Processor Overview].  |
| <b>L2 cache</b>                 |  |
| <b>L3 cache</b>                 |  |
| <b>Linear (virtual) address</b> | The address generated by a core after the segment is applied.  |
| <b>Link</b>                     | Generic term that may refer to an IO link or a coherent link.  |
| <b>LINT</b>                     | Local interrupt.   |
| <b>Logical address</b>          | The address generated by a core before the segment is applied.   |
| <b>LVT</b>                      | Local vector table. A collection of APIC registers that define interrupts for local events. E.g., APIC[530:500] [Extended Interrupt [3:0] Local Vector Table].   |

**Table 3: Definitions**

| <b>Term</b>                  | <b>Definition</b>   |
|------------------------------|---|
| <b>Master abort</b>          | This is a PCI-defined term that is applied to transactions on other than PCI buses. It indicates that the transaction is terminated without affecting the intended target; reads return all 1's; writes are discarded; the master abort error code is returned in the response, if applicable; master abort error bits are set if applicable.   |
| <b>MB</b>                    | Megabyte; 1024 KB.  |
| <b>MCT</b>                   | Memory controller. See <a href="#">2.9 [Northbridge (NB)]</a> .   |
| <b>MCQ</b>                   | Memory controller queue. See <a href="#">2.9 [Northbridge (NB)]</a> .   |
| <b>Micro-op</b>              | Micro-op. Instructions have variable-length encoding and many perform multiple primitive operations. The processor does not execute these complex instructions directly, but, instead, decodes them internally into simpler fixed-length instructions called macro-ops. Processor schedulers subsequently break down macro-ops into sequences of even simpler instructions called micro-ops, each of which specifies a single primitive operation. See the software optimization guide, referenced in <a href="#">1.2 [Reference Documents]</a> . |
| <b>MEMCLK</b>                | Refers to the clock signals, M[B, A][3:0]_CLK, that are driven from the processor to DDR DIMMs.   |
| <b>MMIO</b>                  | Memory-mapped input-output range. This is physical address space that is mapped to the IO functions such as the IO links or MMIO configuration. The IO link MMIO ranges are specified by <a href="#">D18F1x[1CC:180,BC:80] [MMIO Base/Limit]</a> .  |
| <b>MMIO configuration</b>    | Access to configuration space through memory space. See <a href="#">2.8 [Configuration Space]</a> .   |
| <b>MSR</b>                   | Model-specific register. The core includes several MSRs for general configuration and control. See <a href="#">3.11 [MSRs - MSR0000_xxxx]</a> for the beginning of the MSR register definitions.  |
| <b>MTRR</b>                  | Memory-type range register. The MTRRs specify the type of memory associated with various memory ranges. See <a href="#">MSR0000_00FE</a> , <a href="#">MSR0000_020[F:0]</a> , <a href="#">MSR0000_02[6F:68,59:58,50]</a> , and <a href="#">MSR0000_02FF</a> .   |
| <b>NB</b>                    | Northbridge. The transaction routing block of the node. See <a href="#">2.1 [Processor Overview]</a> .  |
| <b>NBC</b>                   | Node Base Core. The lowest numbered core in the node.   |
| <b>NCLK</b>                  | The main northbridge clock. The NCLK frequency is the NB COF.   |
| <b>NFCM</b>                  | Normal flow control mode. This is the flow control mode when neither Display Refresh nor IFCM are in use. See <a href="#">2.9.3.2.5 [Display Refresh And IFCM]</a> .  |
| <b>Node ID</b>               | The identifier assigned to each node, <a href="#">D18F0x60[NodeId]</a> .  |
| <b>Node</b>                  | See <a href="#">2.1 [Processor Overview]</a> .  |
| <b>Normalized address</b>    | Addresses used by DCTs. See <a href="#">2.9 [Northbridge (NB)]</a> .  |
| <b>OW</b>                    | Octword. An 128-bit value.  |
| <b>ODM</b>                   | On-DIMM mirroring. See <a href="#">D18F2x[5C:40]_dct[1:0][OnDimmMirror]</a> .   |
| <b>ODT</b>                   | On-die termination, which is applied DRAM interface signals.  |
| <b>ODTS</b>                  | DRAM On-die thermal sensor.   |
| <b>Operational frequency</b> | The frequency at which the processor operates. See <a href="#">2.5 [Power Management]</a> .   |
| <b>PDS</b>                   | Product data sheet.   |
| <b>Physical address</b>      | Addresses used by cores in transactions sent to the NB.   |

**Table 3: Definitions**

| Term                     | Definition  |
|--------------------------|---|
| <b>PRBS</b>              | Pseudo-random bit sequence.   |
| <b>Probe filter</b>      | See 2.9.4.1 [Probe Filter].   |
| <b>Processor</b>         | See 2.1 [Processor Overview].   |
| <b>PSI</b>               | Power Status Indicator. See 2.5.1.4.1 [PSI_L Bit].  |
| <b>P-state</b>           | Performance state. See 2.5 [Power Management].  |
| <b>PTE</b>               | Page table entry.   |
| <b>QW</b>                | Quadword. A 64-bit value.   |
| <b>RAS</b>               | Reliability, availability and serviceability (industry term). See 2.13 [RAS and Advanced Server Features].  |
| <b>RDQ</b>               | Read data queue.  |
| <b>RX</b>                | Receiver.   |
| <b>SBI</b>               | Sideband Interface. See 2.13.4 [Sideband Interface (SBI)].  |
| <b>Scrubber</b>          | Background memory checking logic. See 2.9.5 [Memory Scrubbers].   |
| <b>Shutdown</b>          | A state in which the affected core waits for either INIT, RESET, or NMI. When shutdown state is entered, a shutdown special cycle is sent on the IO links.  |
| <b>Single-Plane</b>      | Refers to a processor or systemboard where VDD and VDDNB are tied together and operate at the same voltage level. Refer to 2.5.1 [Processor Power Planes And Voltage Control].  |
| <b>Slam</b>              | Refers to change the voltage to a new value in one step (as opposed to stepping). See 2.5.1.5.1 [Hardware-Initiated Voltage Transitions].   |
| <b>SMAF</b>              | System management action field. This is the code passed from the SMC to the processors in STPCLK assertion messages. The action taken by the processors in response to this message is specified by D18F3x[84:80] [ACPI Power State Control]. |
| <b>SMBus</b>             | System management bus. Refers to the protocol on which the serial VID interface (SVI) commands and SBI are based. See 2.5.1 [Processor Power Planes And Voltage Control], 2.13.4 [Sideband Interface (SBI)], and 1.2 [Reference Documents].   |
| <b>SMC</b>               | System management controller. This is the platform device that communicates system management state information to the processor through an IO link, typically the system IO hub.   |
| <b>SMI</b>               | System management interrupt. See 2.4.8.2.1 [SMM Overview].  |
| <b>SMM</b>               | System management mode. See 2.4.8.2 [System Management Mode (SMM)].   |
| <b>Southbridge</b>       | Same as IO hub.   |
| <b>Speculative event</b> | A performance monitor event counter that counts all occurrences of the event even if the event occurs during speculative code execution.  |
| <b>Sublink</b>           | An 8-bit-or-less (CAD) block of link signals of a link; each sublink of a link may connect to a different device. See 2.12 [Links].   |
| <b>SVI</b>               | Serial VID interface. See 2.5.1 [Processor Power Planes And Voltage Control].   |
| <b>SVM</b>               | Secure virtual machine. See 2.4.9 [Secure Virtual Machine Mode (SVM)].  |
| <b>Sync flood</b>        | The propagation of continuous sync packets to all links. This is used to quickly stop the transmission of potentially bad data when there are no other means to do so. See the link specification for additional information.                 |
| <b>TCC</b>               | Temperature calculation circuit. See 2.11 [Thermal Functions].  |
| <b>Tctl</b>              | Processor temperature control value. See 2.11.2 [Temperature-Driven Logic].   |
| <b>TDC</b>               | Thermal design current. See the AMD Infrastructure Roadmap, #41482.   |

**Table 3: Definitions**

| Term                | Definition  |
|---------------------|---|
| <b>TDP</b>          | Thermal design power. A power consumption parameter that is used in conjunction with thermal specifications to design appropriate cooling solutions for the processor. See <a href="#">2.5.2.1.1.1 [TDP Limiting]</a> . |
| <b>Token</b>        | A scheduler entry used in various northbridge queues to track outstanding requests. See <a href="#">D18F3x140 [SRI to XCS Token Count]</a> on Page 461.   |
| <b>Triple-Plane</b> | Refers to a processor or systemboard where VDD0, VDD1, and VDDNB are separate and may operate at independent voltage levels. Refer to <a href="#">2.5.1 [Processor Power Planes And Voltage Control]</a> .              |
| <b>TX</b>           | Transmitter.  |
| <b>UI</b>           | Unit interval. This is the amount of time equal to one half of a clock cycle.   |
| <b>UMA</b>          | Unified memory architecture. This is a type of display device that uses a frame buffer located in main memory.  |
| <b>Unganged</b>     | A link that has been divided into multiple sublinks.  |
| <b>VDD</b>          | Main power supply to the processor core logic.  |
| <b>VDDNB</b>        | Main power supply to the processor NB logic.  |
| <b>VID</b>          | Voltage level identifier. See <a href="#">2.5.1 [Processor Power Planes And Voltage Control]</a> .  |
| <b>Virtual CAS</b>  | The clock in which CAS is asserted for the burst, N, plus the burst length (in MEMCLKs), minus 1; so the last clock of virtual CAS = $N + (BL/2) - 1$ .   |
| <b>VRM</b>          | Voltage regulator module.   |
| <b>W</b>            | Word. A 16-bit value.   |
| <b>Warm reset</b>   | RESET_L is asserted only (while PWROK stays high). See <a href="#">2.3 [Processor Initialization]</a> .   |
| <b>WDT</b>          | Watchdog timer. A timer that detects activity and triggers an error if a specified period of time expires without the activity. For example, see the NB watchdog timer in <a href="#">D18F3x40 [MCA NB Control]</a> .   |
| <b>WDQ</b>          | Write data queue.   |
| <b>XBAR</b>         | Cross bar; command packet switch. See <a href="#">2.9 [Northbridge (NB)]</a> .  |

## 1.5 Changes Between Revisions and Product Variations

### 1.5.1 Revision Conventions

The processor revision is specified by [CPUID Fn0000\\_0001\\_EAX \[Family, Model, Stepping Identifiers\]](#) or [CPUID Fn8000\\_0001\\_EAX \[Family, Model, Stepping Identifiers\]](#). This document uses a mnemonic of the format [OR\\_B2](#) instead of specific model numbers. The following table contains the definitions based on model and stepping used in this document. All behavior marked with a “>=” applies to future revisions. E.g. ([PROC](#)>=[OR\\_B2](#)). See the revision guide for additional information about revision determination. See [1.2 \[Reference Documents\]](#).

**Table 4: Processor revision conventions**

| Term         | Definition  |
|--------------|---|
| <b>PROC</b>  | Processor. PROC = {CPUID Fn0000_0001_EAX[ExtFamily], CPUID Fn0000_0001_EAX[ExtModel], CPUID Fn0000_0001_EAX[BaseModel], CPUID Fn0000_0001_EAX[Stepping]}. |
| <b>OR_B2</b> | OR_B2 = {06h,01h,2h}.   |

### 1.5.2 Major Changes Relative to Family 10h Revision D Processors

- CPU core changes:
  - New processor core architecture based on compute units. Each compute unit implements 2 cores.
    - Integer cores share an FPU.
    - Support for up to 8 cores per node in product variations.
  - MSR Changes:
    - Some MSR's are shared between cores. See 2.4.1.1 [Registers Shared by Cores in a Compute Unit].
    - MSR0000\_0000 [Load-Store MCA Address]: Changed to be an alias of MSR0000\_0402 [LS Machine Check Address (MC0\_ADDR)] instead of DC/MC3\_ADDR (MSR0000\_040E [MC3 Machine Check Address (MC3\_ADDR)]) because LS/MC3 was merged with DC/MC0.
    - MSR0000\_0001 [Load-Store MCA Status]: Changed to be an alias of MSR0000\_0401 [LS Machine Check Status (MC0\_STATUS)] instead of DC/MC3\_ADDR (MSR0000\_040D [MC3 Machine Check Status (MC3\_STATUS)]) because LS/MC3 was merged with DC/MC0.
    - MSR0000\_0010 [Time Stamp Counter (TSC)]: Deprecated TSC rate at NB P-state 0 MSRC001\_0015[TscFreqSel]==0; TSC always runs at P0 frequency.
    - MSR0000\_00E7 [Max Performance Frequency Clock Count (MPERF)]: Added.
    - MSR0000\_00E8 [Actual Performance Frequency Clock Count (APERF)]: Added.
    - MSR0000\_0179 [Global Machine Check Capabilities (MCG\_CAP)]: Count changed to 07h. (7 banks)
    - MSR0000\_017B [Global Machine Check Exception Reporting Control (MCG\_CTL)]: MC0 repurposed to DC; DC/MC3 merged into LS/MC0; MC3 deprecated; MC5 repurposed to EX; MC6 added as FP.
    - MSR0000\_020[F:0] [Variable-Size MTRRs Base/Mask]: SharedC.
    - MSR0000\_02[6F:68,59:58,50] [Fixed-Size MTRRs]: SharedC.
    - MSR0000\_02FF [MTRR Default Memory Type (MTRRdefType)]: SharedC.
    - MSR0000\_0400 [LS Machine Check Control (MC0\_CTL)]: Changed.
    - MSR0000\_0401 [LS Machine Check Status (MC0\_STATUS)]: Added Deferred, Poison; removed Scrub.
    - MSR0000\_0403 [LS Machine Check Miscellaneous (MC0\_MISC)]: Added LS thresholding.
    - MSR0000\_0404 [IF Machine Check Control (MC1\_CTL)]: SharedC; Changed.
    - MSR0000\_0407 [IF Machine Check Miscellaneous (MC1\_MISC)]: Added IC thresholding.
    - MSR0000\_0408 [CU Machine Check Control (MC2\_CTL)]: SharedC; changed; BU now named CU.
    - MSR0000\_040B [CU Machine Check Miscellaneous (MC2\_MISC)]: Added CU thresholding.
    - MSR0000\_040C [MC3 Machine Check Control (MC3\_CTL)]: Events moved to MC0/LS.
    - MSR0000\_0410 [NB Machine Check Control (MC4\_CTL)]: Changed.
    - MSR0000\_0414 [EX Machine Check Control (MC5\_CTL)]: Changed.
    - MSR0000\_0417 [EX Machine Check Miscellaneous (MC5\_MISC)]: Added EX thresholding.
    - MSR0000\_0418 [FP Machine Check Control (MC6\_CTL)]: SharedC; Added.
    - MSRC000\_0104 [Time Stamp Counter Ratio (TscRateMsr)]: Added effective frequency interface.
    - MSRC000\_0105 [Lightweight Profile Configuration (LWP\_CFG)], MSRC000\_0106 [Lightweight

- Profile Control Block Address (LWP\_CBADDR]): Added LWP.
- MSRC000\_040A [Machine Check Misc 4 (Thresholding) Register 3 (MC4\_MISC3)]: Dropped.
  - MSRC001\_00[03:00] [Performance Event Select (PERF\_CTL[3:0])], MSRC001\_00[07:04] [Performance Event Counter (PERF\_CTR[3:0])]: See 1.5.2.1 [Major Changes to Performance Counters Relative to Fam10h RevD].
  - MSRC001\_0010 [System Configuration (SYS\_CFG)]: SharedC; Dropped ChgToDirtyDis, SetDirtyEnO, SetDirtyEnS, SetDirtyEnE.
  - MSRC001\_0015 [Hardware Configuration (HWCR)]:
    - Dropped TscFreqSel; TSC can no longer be selected to run at NB P0-state.
    - Dropped MisAlignSseDis; ability to disable misaligned SSE support is dropped.
    - Dropped SseDis; ability to disable SSE, SSE2, SSE3, and SSE4A is dropped.
    - Dropped LimitCpuidStdMaxVal; ability to hide standard functions >1 is dropped.
    - Dropped PatchDis; ability to disable patches is dropped.
    - Dropped SlowFence; ability to select slow fence is dropped.
  - MSRC001\_00[18,16] [IO Range Base (IORR\_BASE[1:0])]: SharedC.
  - MSRC001\_00[19,17] [IO Range Mask (IORR\_MASK[1:0])]: SharedC.
  - MSRC001\_001A [Top Of Memory (TOP\_MEM)]: SharedC.
  - MSRC001\_001D [Top Of Memory 2 (TOM2)]: SharedC.
  - MSRC001\_001F [NB Configuration 1 (NB\_CFG1)]:
    - Dropped InitApicIdCpuIdLo==0; CoreNum is always in the least significant position in ApicId.
  - MSRC001\_00[35:30] [Processor Name String]: SharedNC.
  - MSRC001\_003E [Hardware Thermal Control (HTC)]: Changed to hardware P-state numbering.
  - MSRC001\_0045 [IF Machine Check Control Mask (MC1\_CTL\_MASK)]: SharedC.
  - MSRC001\_0046 [CU Machine Check Control Mask (MC2\_CTL\_MASK)]: SharedC.
  - MSRC001\_004A [FP Machine Check Control Mask (MC6\_CTL\_MASK)]: SharedC.
  - MSRC001\_00[53:50] [IO Trap (SMI\_ON\_IO\_TRAP\_[3:0])]: SharedNC.
  - MSRC001\_0054 [IO Trap Control (SMI\_ON\_IO\_TRAP\_CTL\_STS)]: SharedNC.
  - MSRC001\_0055 [Interrupt Pending]: SharedNC. Dropped C1eOnCmpHalt; SmiOnCmpHalt.
  - MSRC001\_0061 [P-state Current Limit]: SharedC.
  - MSRC001\_0063 [P-state Status]: SharedC.
  - MSRC001\_00[6B:64] [P-state [7:0]]: SharedC. Added 3 P-states. Dropped NbVid and NbDid. Added NbPstate.
  - MSRC001\_0070 [COFVID Control]: Dropped NbVid and NbDid. Added NbPstate.
  - MSRC001\_0071 [COFVID Status]: SharedC, Dropped CurNbDid, Added NbPstateDis.
  - MSRC001\_0073 [C-state Base Address]: Added.
  - MSRC001\_0075 [APML TDP Limit]: Added. Note: SBI-only.
  - MSRC001\_0077 [Processor Power in TDP]: Added. Note: SBI-only.
  - MSRC001\_0078 [Power Averaging Period]: Added. Note: SBI-only.
  - MSRC001\_0079 [DRAM Controller Command Throttle]: Added. Note: SBI-only.
  - MSRC001\_020[A,8,6,4,2,0] [Performance Event Select (PERF\_CTL[5:0])], MSRC001\_020[B,9,7,5,3,1] [Performance Event Counter (PERF\_CTR[5:0])], MSRC001\_024[6,4,2,0] [Northbridge Performance Event Select (NB\_PERF\_CTL[3:0])], MSRC001\_024[7,5,3,1] [Northbridge Performance Event Counter (NB\_PERF\_CTR[3:0])]: See 1.5.2.1 [Major Changes to Performance Counters Relative to Fam10h RevD].
  - MSRC001\_1030 [IBS Fetch Control (IC\_IBS\_CTL)]:
    - IbsL1TlbPgSz: Added 1 GB page.
  - MSRC001\_1033 [IBS Execution Control (SC\_IBS\_CTL)]:
    - IbsOpCurCnt, IbsOpMaxCnt: Increased size as indicated by CPUID Fn8000\_001B\_EAX[OpCntExt].
  - MSRC001\_1035 [IBS Op Data (SC\_IBS\_DATA)]:
    - IbsRipInvalid: Added RIP invalid check as indicated by CPUID Fn8000\_001B\_EAX[RipIn-

- validChk].
- [MSRC001\\_1037 \[IBS Op Data 3 \(DC\\_IBS\\_DATA, IbsOpData3\)\]](#):
  - [IbsDcL2TlbHit1G](#): Dropped because there is no DC L2 TLB.
- [MSRC001\\_103B \[IBS Branch Target Address \(BP\\_IBSTGT\\_RIP\)\]](#): Added; support indicated by [CPUID Fn8000\\_001B\\_EAX\[BrnTrgt\]](#).
- Instruction Set Architecture changes:
  - [CPUID Fn0000\\_0001\\_ECX\[AVX\]](#): Added AVX instruction support.
  - [CPUID Fn0000\\_0001\\_ECX\[XSAVE, OSXSAVE\]](#), [CPUID Fn0000\\_000D](#): Added XSAVE support.
  - [CPUID Fn0000\\_0001\\_ECX\[AES\]](#): Added AES instruction support.
  - [CPUID Fn0000\\_0001\\_ECX\[SSE41, SSE42\]](#): Added SSE4.1 and SSE4.2 instruction support.
  - [CPUID Fn0000\\_0001\\_ECX\[SSSE3\]](#): Added SSSE3 instruction support.
  - [CPUID Fn0000\\_0001\\_ECX\[PCLMULQDQ\]](#): Added PCLMULQDQ instruction support.
  - [CPUID Fn0000\\_0006\\_ECX\[EffFreq\]](#): Added effective frequency interface.
  - [CPUID Fn0000\\_000D\\_EAX\\_x0-CPUID Fn0000\\_000D\\_EDX\\_x3E](#): Added XSAVE/XRSTOR.
  - [CPUID Fn8000\\_0001\\_EBX\[BrandId\]](#): Dropped.
  - [CPUID Fn8000\\_0001\\_ECX\[FMA4\]](#): Added FMA4 instruction support.
  - [CPUID Fn8000\\_0001\\_ECX\[LWP\]](#), [CPUID Fn8000\\_001C](#): Added lightweight profiling support.
  - [CPUID Fn8000\\_0001\\_ECX\[XOP\]](#): Added XOP instruction support.
  - [CPUID Fn8000\\_0001\\_EDX\[3DNow, 3DNowExt\]](#): Dropped 3DNow!™ and 3DNow!™ extensions.
  - [CPUID Fn8000\\_0007\\_EDX\[CPB\]](#): Added Core Performance Boost.
  - [CPUID Fn8000\\_0007\\_EDX\[STC\]](#): Deprecated.
  - [CPUID Fn8000\\_0008\\_EAX\[GuestPhysAddrSize\]](#): Added.
  - [CPUID Fn8000\\_0008\\_ECX\[ApicIdCoreIdSize\]](#): APIC ID size increased.
  - [CPUID Fn8000\\_000A\\_EDX\[TscRateMsr\]](#): Added TSC ratio.
  - [CPUID Fn8000\\_000A\\_EDX\[VmcbClean\]](#): Added VMCB clean bits.
  - [CPUID Fn8000\\_000A\\_EDX\[FlushByAsid\]](#): Added flush by ASID.
  - [CPUID Fn8000\\_000A\\_EDX\[DecodeAssists\]](#): Added decode assists.
  - [CPUID Fn8000\\_001B\\_EAX\[BrnTrgt, OpCntExt, RipInvalidChk\]](#): Added.
  - [CPUID Fn8000\\_001C\\_EAX-CPUID Fn8000\\_001C\\_EDX](#): Added LWP.
- L1, L2, and L3 Caches:
  - DC: 16 KB, 4-way, write-through, per-core.
  - IC: 64 KB, 2-way, shared between cores of a compute unit.
  - L2: 1 MB or 2MB (Product-specific), 16-way associative, shared between both cores of a compute unit.
  - L3: Up to 8 MB (Product-specific), up to 64-way associative (Product-specific), shared between compute units on node.
- TLB's:
  - Fam10h splintered 1 GB pages to 2 MB pages. Fam15h caches 1 GB pages without splintering.
  - D, L1TLB:
    - 4 KB: 32 entries, fully associative.
    - 2 MB: 32 entries, fully associative.
    - 1 GB: 32 entries, fully associative.
  - D, L2TLB:
    - None. Full size of unified TLB reported as L2 DTLB.
  - I, L1TLB:
    - 4 KB: 48 entries, fully associative.
    - 2 MB, 1 GB: 24 entries, fully associative. 2M and 1G entries share the same L1TLB bank.
  - I, L2TLB:
    - 4 KB: 512 entries, 4-way associative. (Same as Fam10h)
    - 2 MB: None. (Same as Fam10h)
    - 1 GB: None.
  - Unified TLB:

- 1024 entries, 8-way associative, any entry can cache:
  - D: 4K, 2M, 4M, or 1G translation.
  - I: 2M, 4M, or 1G translation. Not 4K ITLB translations.
  - Notes: Unified TLB natively stores 4M translations. An entry allocated by one core is not visible to the other core of a compute unit.
- Memory controller (MCT) and DRAM controllers (DCTs) additions:
  - Support for 933 MHz (1866 MT/s) MEMCLK frequency.
  - Low-voltage DDR3 support; Support to run DDR3 at 1.35 V and 1.25 V for power savings.
  - LRDIMM support; 1-3 LRDIMMs supported per channel.
  - DRAM Prefetcher:
    - Increased DRAM prefetch table size from 16 to 32.
    - Differentiate between core prefetch requests and core demand requests.
  - DCT register access changed. See [2.10.1](#).
  - Hardware generated DRAM training patterns. See [2.10.5.8.6.1](#).
  - Dropped support for DRAM channel ganging.
  - Dropped support for DDR2.
  - [D18F2x110](#)[DctSelIntLvAddr]==01b not supported if node interleaving is enabled.
- Links and IO additions:
  - Upstream EOI handled as a protocol violation.
  - Link mapping changed in G34r1 package. See [2.12.1.5](#).
- RAS-related additions:
  - Added MCA bank for FP errors. See [2.13.1](#).
  - Data poisoning and deferred errors.
  - Core error thresholding via polling.
  - MCI\_STATUS[Overflow] no longer indicates a fatal condition. See [MSR0000\\_0401](#)[Overflow].
- General Northbridge changes:
  - Added Accelerated Transition to Modified protocol in L3, uses the Muw (modified-unwritten) state.
  - Probe filter associativity increased from 4 to 8 way.
  - Removed extended MMIO map (F1x114\_x[3:2]). Added 4 base/mask pairs to the base MMIO map and changed all base MMIO map entries to support PhysAddr[47:40]. See [D18F1x\[1CC:180,BC:80\]](#).
  - Victim distribution to improve 2P G34 routing. See [2.9.3.2.4.3](#) [Victim Distribution Mode].
  - GART cache size reduced from 32 entries to 16 entries. See [2.9.2](#) [GART].
- Power management:
  - Support for up to 8 P-states.
  - Support for up to 2 NB P-states in a multi-node system.
  - **APM**: Allows the processor to deterministically provide maximum performance while remaining within the specified power delivery and removal envelope. See [2.5.2.1.1](#) [Application Power Management (APM)].
  - IO based C-state interface; 3 IO based C-states supported. See [2.5.3.1](#).
  - Core C6 (CC6) support. See [2.5.3.3.3](#) [Core C6 (CC6) State].
  - C-state Boost. See [D18F4x16C](#) [APM TDP Control].
  - Added IDLE\_EXIT\_L support for MT C1E for the AM3r2 package.
  - Effective frequency interface. See [CPUID Fn0000\\_0006\\_ECX](#)[EffFreq].
  - DRAM Power Management:
    - The Command/Address/Bank buses tri-state when deselected.
    - Added software throttle control over DRAM bandwidth. See [2.10.10](#).
  - Dropped PVI regulator interface.
- Core/NB performance counters:
  - See [1.5.2.1](#) [Major Changes to Performance Counters Relative to Fam10h RevD].

### 1.5.2.1 Major Changes to Performance Counters Relative to Fam10h RevD

- Core performance counters:
  - Added 2 core performance counters; added new MSR location at [MSRC001\\_020\[A,8,6,4,2,0\]](#); alias [MSRC001\\_00\[03:00\]](#) to [MSRC001\\_020\[6,4,2,0\]](#). See [MSRC001\\_020\[A,8,6,4,2,0\]](#).
  - Added multi-event support. See 2.7.1 [Core Performance Monitor Counters].
  - Not all performance monitor events can be counted on all counters. See 2.7.1 [Core Performance Monitor Counters].
  - Changed [PMCx000 \[FPU Pipe Assignment\]](#).
  - Changed [PMCx001 \[FP Scheduler Empty\]](#).
  - Dropped [PMCx002 \[Dispatched Fast Flag FPU Operations\]](#).
  - Changed [PMCx003 \[Retired Floating Point Ops\]](#).
  - Changed [PMCx004 \[Number of Move Elimination and Scalar Op Optimization\]](#).
  - Changed [PMCx005 \[Retired Serializing Ops\]](#).
  - Changed [PMCx006 \[Number of Cycles that a Bottom-Execute uop is in the FP Scheduler\]](#).
  - Changed [PMCx023 \[Load Queue/Store Queue Full\]](#).
  - Changed [PMCx02A \[Canceled Store to Load Forward Operations\]](#).
  - Added [PMCx030 \[Executed CLFLUSH Instructions\]](#).
  - Changed [PMCx041 \[Data Cache Misses\]](#).
  - Changed [PMCx042 \[Data Cache Refills from L2 or System\]](#).
  - Changed [PMCx043 \[Data Cache Refills from System\]](#).
  - Dropped [PMCx044 \[Data Cache Lines Evicted\]](#).
  - Changed [PMCx045 \[Unified TLB Hit\]](#).
  - Changed [PMCx046 \[Unified TLB Miss\]](#).
  - Dropped [PMCx048 \[Microarchitectural Late Cancel of an Access\]](#).
  - Dropped [PMCx049 \[Microarchitectural Early Cancel of an Access\]](#).
  - Dropped [PMCx04A \[Single-bit ECC Errors Recorded by Scrubber\]](#).
  - Dropped [PMCx04C \[DCACHE Misses by Locked Instructions\]](#).

  - Added [NBPMCx4EF \[L3 Latency\]](#).

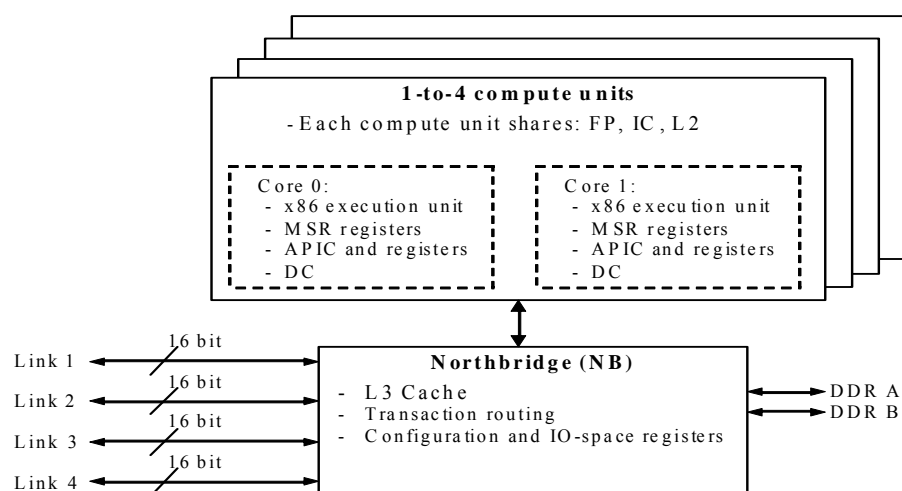

## 2 Functional Description

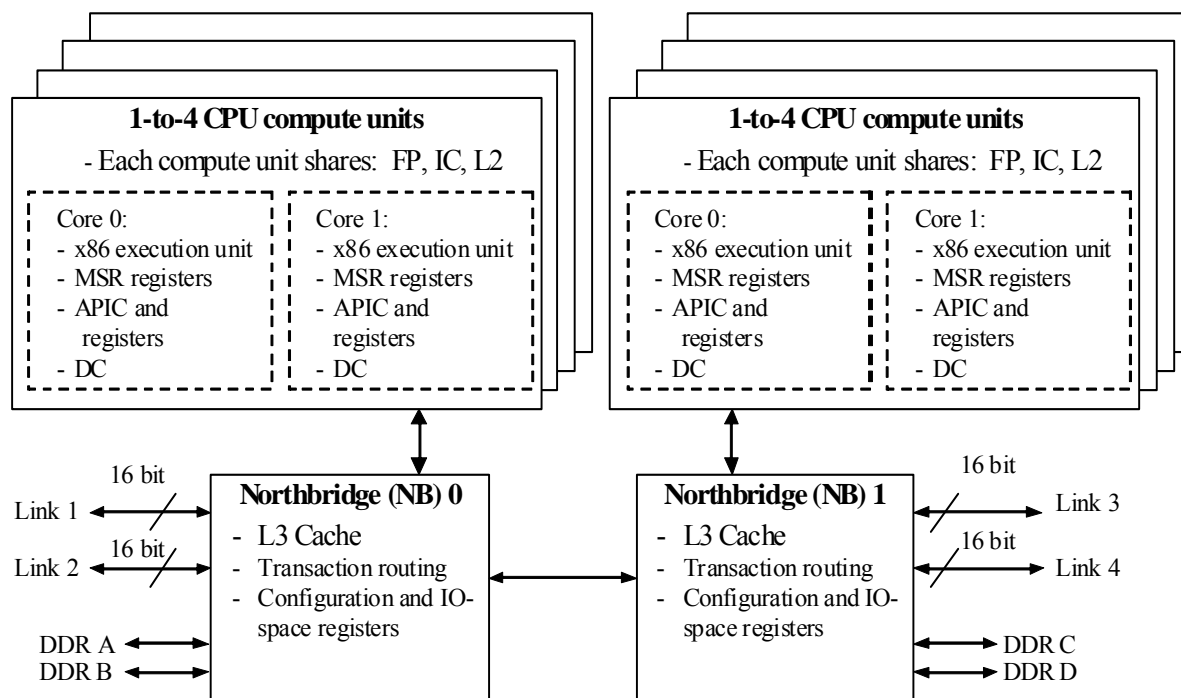

### 2.1 Processor Overview

The *processor* is defined as follows:

- The processor is a package that contains one or more nodes.
- Supports x86-based instruction sets.
- A *node*, is an integrated circuit device that includes:
  - One to 8 cores (one to four compute units).
  - Includes up to four high-speed communication interfaces (referred to as *links*) that may be configured for HyperTransport™ technology (referred to as *IO links*) or for AMD-proprietary inter-processor communication (referred to as *coherent links*)
  - Up to two 64-bit DDR3 interfaces for communication to system memory.
  - One communication packet routing block referred to as the *northbridge* (NB).

**Figure 1: A Single-Node Processor**

**Figure 2: A Dual-Node Processor**

Each *compute unit* includes 2 cores each having an x86 instruction execution logic and first-level (L1) data cache. The FP unit, second level (L2) general-purpose cache, first-level instruction cache, are shared between the compute units. There is a set of MSRs and APIC registers associated with each core. Processors that include multiple cores are said to incorporate *chip multi-processing* or CMP.

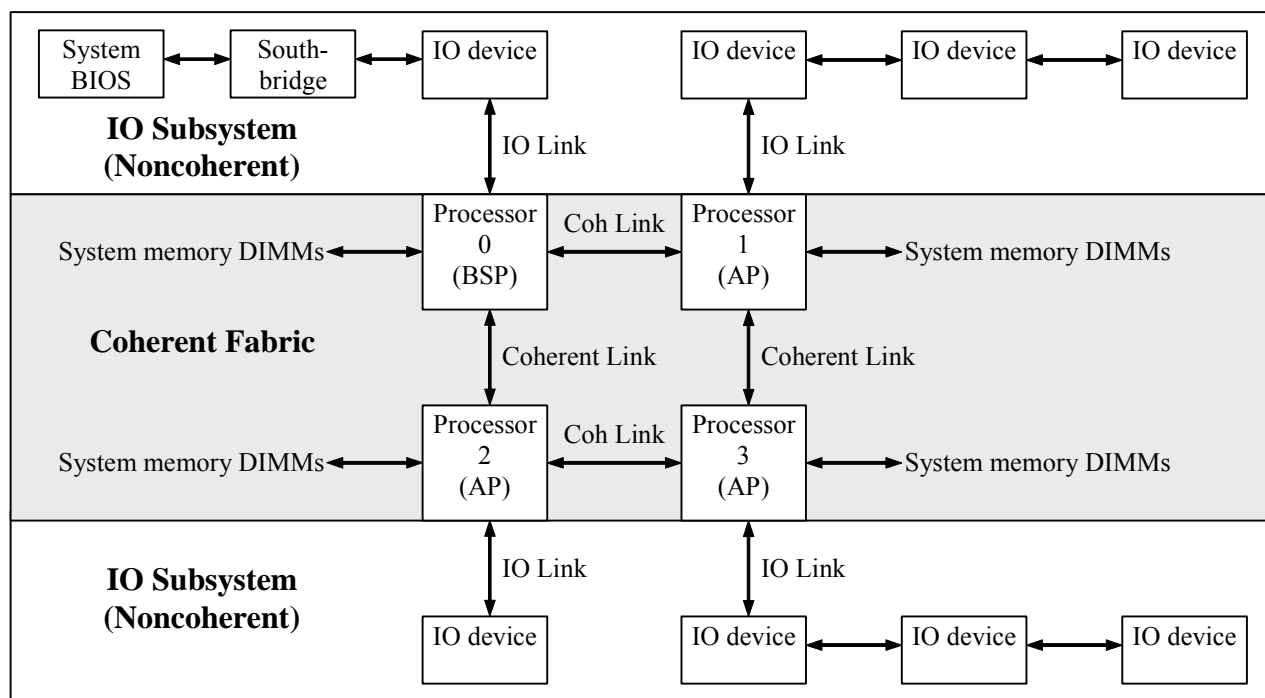

Each link can be configured to operate under the rules of one of the following interface specifications: (1) AMD proprietary, coherent inter-processor link; or (2) non-coherent HyperTransport™ IO link. When a link is configured for non-coherent IO traffic, it is referred to as an IO link.

Each DRAM interface supports a 64-bit memory channel.

The NB routes transactions between the cores, the link, and the DRAM interfaces. It includes the configuration register space for the device. It may include an L3 cache as well.

## 2.2 System Overview

The following diagram illustrates the expected system architecture. Smaller systems may not include multiple processors or multiple IO links. Larger systems may include many more processors. Each processor in the coherent fabric communicates with other processors through the coherent link protocol. Processors communicate with the IO subsystem through IO links.

**Figure 3: System Diagram**

## 2.3 Processor Initialization

This section describes the initialization sequence after a cold reset.

The processor that is connected to the IO hub is the BSP. Core 0 of the BSP, called the BSC, begins executing code from the reset vector. Core 0 on all other nodes do not fetch code until `D18F0x6C[ReqDis]` for that node is cleared. The remaining cores do not fetch code until their enable bits are set (`D18F0x1DC[CpuEn]`).

### 2.3.1 BSP initialization

The BSP must perform the following tasks as part of boot.

- Store BIST information from the EAX register into an unused processor register.
- `D18F0x6C[InitDet]` may be used by BIOS to differentiate between INIT and cold/warm reset.
- Determine type of startup using `D18F0x6C[ColdRstDet]`:
  - If this is a cold reset then BIOS must clear `MSR0000_0411 [NB Machine Check Status (MC4_STATUS)]`.
  - If this is a warm reset then BIOS may check for valid MCA errors and if present save the status for later use. See 2.13.1.6 [Handling Machine Check Exceptions].
- Enable the cache, program the MTRRs for CAR and initialize CAR. See 2.3.3 [Using L2 Cache as General Storage During Boot].
- Setup of APIC (2.4.8.1.3 [ApicId Enumeration Requirements]).
- Perform coherent link enumeration (routing table and NodeID), as described in 2.9.3.2 [HyperTransport™ Technology Routing].
- Configure all IO link devices.
  - Set configuration-base and -limit (`D18F1x[EC:E0] [Configuration Map][BusNumBase, BusNum-Limit]`).

- Perform device enumeration for all IO link devices (see link specification).
- If required, reallocate data and flow control buffers of the links (see [D18F0x\[F0,D0,B0,90\]](#) [Link Base Channel Buffer Count] and [D18F0x\[F4,D4,B4,94\]](#) [Link Isochronous Channel Buffer Count]).
- Configure link speed and width. See link specification.
- Issue system warm reset.
- Configure processor power management. See [2.4 \[Processor Core\]](#).
- If supported, allow other cores to begin fetching instructions by clearing [D18F0x6C\[ReqDis\]](#) in the PCI configuration space of all other nodes and setting [D18F0x1DC\[CpuEn\]](#) in the PCI configuration space of all nodes. See [2.4.3 \[Processor Cores and Downcoring\]](#).

### 2.3.2 AP initialization

All other processor cores other than core 0 of node 0 begin executing code from the reset vector. They must perform the following tasks as part of boot.

- Store BIST information from the `eax` register into an unused processor register.
- [D18F0x6C\[InitDet\]](#) may be used by BIOS to differentiate between INIT and cold/warm reset.
- Determine type of startup using [D18F0x6C\[ColdRstDet\]](#):
  - If this is a cold reset then BIOS must clear [MSR0000\\_0411 \[NB Machine Check Status \(MC4\\_STATUS\)\]](#).
  - If this is a warm reset then BIOS may check for valid MCA errors and if present save the status for later use. See [2.13.1.6 \[Handling Machine Check Exceptions\]](#).
- Set up the local APIC. See [2.4.8.1.3 \[ApicId Enumeration Requirements\]](#).
- Configure processor power management. See [2.4 \[Processor Core\]](#).

### 2.3.3 Using L2 Cache as General Storage During Boot

Prior to initializing the DRAM controller for system memory, BIOS may use the L2 cache of each core as general storage.

The L2 cache as general storage is described as follows:

- Each compute unit has its own L2 cache.
- BIOS manages the mapping of the L2 storage such that cacheable accesses do not cause L2 victims.
- The L2 size, L2 associativity, and L2 line size is determined by reading [CPUID Fn8000\\_0006\\_ECX\[L2Size, L2Assoc, L2LineSize\]](#). L2WayNum is defined to be the number of ways indicated by the L2Assoc code.
  - The L2 cache is viewed as (L2Size/L2LineSize) cache lines of storage, organized as L2WayNum ways, each way being (L2Size/L2WayNum) in size.
    - E.g. [CPUID Fn8000\\_0006\\_ECX\[L2Assoc\]=8h](#) (16 ways) so L2WayNum=16 (there are 16 ways). If L2Size=512KB then there are 16 blocks of cache, each 512KB/16 in size, or 32KB each.
  - For each of the following values of L2Size, the following values are defined:
    - L2Size=1 MB: L2Tag=PhysAddr[47:16], L2WayIndex=PhysAddr[15:6].
    - L2Size=2 MB: L2Tag=PhysAddr[47:17], L2WayIndex=PhysAddr[16:6].
  - PhysAddr[5:0] addresses the L2LineSize number of bytes of storage associated with the cache line.
  - The L2 cache, when allocating a line at L2WayIndex:
    - Picks an invalid way before picking a valid way.
    - Prioritizes the picking of invalid ways such that way L2WayNum-1 is the highest priority and 0 is the lowest priority.
  - It is recommended that BIOS assume a simpler allocation of L2 cache memory, being L2WayNum size-aligned blocks of memory, each being L2Size/L2WayNum bytes.
  - BIOS can rely on a minimum L2Size of 512 KB and can rely on being able to use a minimum of 14 ways for general storage. See [CPUID Fn8000\\_0006\\_ECX\[L2Size\]](#). See initialization requirements below for

[MSRC001\\_1023](#)[L2WayLock, L2FirstLockedWay].

The following memory types are supported:

- WP-IO: BIOS ROM may be assigned the write-protect IO memory type and may be accessed read-only as data and fetched as instructions.
  - WP-IO accesses, both read and write, do not get evicted to the L2 and therefore do not need to be considered for allocation into the L2.
- WB-DRAM: General storage may be assigned the write-back DRAM memory type and may be accessed as read-write data, but not accessed by instruction fetch.
  - BIOS initializes an L2LineSize sized and aligned location in the L2 cache, mapped as write-back DRAM, with 1 read to at least 1 byte of the L2LineSize sized and aligned WB-DRAM address. BIOS may store to a line only after it has been allocated by a load.
  - Fills, sent to the disabled memory controller, return undefined data.
- All of memory space that is not accessed as WP-IO or WB-DRAM space must be marked as UC memory type.
- In order to prevent victimizing L2 data, no more than L2WayNum cache lines accessed as WB-DRAM may have the same L2WayIndex.
  - Software does not need to know which ways the L2WayNum lines are allocated to for any given value of L2WayIndex, only that invalid ways will be selected for allocation before valid ways will be selected for allocation.
  - Software is not allowed to deallocate a line in the L2 by using CLFLUSH. See [2.10.5.8.6.1 \[DRAM Training Pattern Generation\]](#).

BIOS must also follow the requirements in [2.3.3.1 \[Using L2 Cache as General Storage During Boot\]](#).

Performance monitor event [PMCx07F](#)[1], titled “L2 Writebacks to system“, can be used to indicate whether L2 dirty data was lost by being victimized and sent to the disabled memory controller.

The following requirements must be satisfied prior to using the cache as general storage:

- Paging must be disabled.
- [MSRC001\\_0015](#)[INVDWBINVD]=0.
- [MSRC001\\_1020](#)[DisSS]=1.
- [MSRC001\\_1021](#)[DisSpecTlbRld]=1. Disable speculative ITLB reloads.
- [MSRC001\\_1022](#)[DisSpecTlbRld]=1. Disable speculative DTLB reloads.
- [MSRC001\\_1022](#)[DisHwPf]=1.
- If ([MSRC001\\_102B](#)[CombineCr0Cd]==1) Then [MSRC001\\_102B](#)[CombineCr0Cd]=0. See [MSRC001\\_102B](#)[CombineCr0Cd].
- CLFLUSH, INVD, and WBINVD must not be used during [CAR](#) but may be used when tearing down [CAR](#) for all compute units on a node.
- The BIOS must not use SSE, or MMX™ instructions, with the exception of the following list: MOVD, MOVQ, MOVDQA, MOVQ2DQ, MOVDQ2Q.
- The BIOS must not enable exceptions, page-faults, and other interrupts.
- BIOS must not use software prefetches.
- UC-DRAM: All of DRAM that is not accessed as [CAR](#) memory region, marked as WB-DRAM, must be marked as UC memory type. This prevents speculative accesses that fall outside of the [CAR](#) memory region from getting to the caches and DRAM controller.
- If ([MSRC001\\_1023](#)[L2WayLock]==1) then:
  - Only the ways 0-([MSRC001\\_1023](#)[L2FirstLockedWay]-1) may be used for general storage.
  - BIOS can rely on [MSRC001\\_1023](#)[L2FirstLockedWay] to have a minimum value of Eh.

When BIOS has completed using the cache for general storage the following steps are followed:

1. An INVD instruction should be executed on each core that used cache as general storage; an INVD should only be issued when all cores on all nodes have completed using the cache for general storage.
2. If DRAM is initialized and there is data in the cache that needs to get moved to main memory, CLFLUSH or WBINVD may be used instead of INVD, but software must ensure that needed data in main memory is not overwritten.
3. Program the following configuration state:
  - [MSRC001\\_0015](#)[INVDWBINVD]=1.
  - [MSRC001\\_1020](#)[DisSS]=0.
  - [MSRC001\\_1021](#)[DisSpecTlbRld]=0.
  - [MSRC001\\_1022](#)[DisSpecTlbRld]=0.
  - [MSRC001\\_1022](#)[DisHwPf]=0.

### 2.3.3.1 Using L2 Cache as General Storage During Boot

BIOS must follow the requirements in this section in addition to the requirements stated in section [2.3.3 \[Using L2 Cache as General Storage During Boot\]](#).

BIOS must ensure that no WB-DRAM region for one L2 on a node overlaps with a WB-DRAM region for another L2 on the same node.

### 2.3.4 Multiprocessing Capability Detection

The multiprocessing capability of the processor is determined by [D18F3xE8](#)[MPCap].

During boot, the BIOS checks the multiprocessing capability of all processors, and configures the system accordingly.

Multiprocessing capability detection is not required in a single processor system.

All processors must be dual-processor (DP) capable or multiprocessor (MP) capable in a DP system. If any processor is not at least DP capable, the BIOS must configure the BSP as a uni-processor (UP), and must not initialize the AP.

All processors must be MP capable in an MP system. If any processor is not MP capable, the BIOS must configure the BSP as a UP processor, and must not initialize APs.

If all processors do not have adequate multiprocessing capability for a DP or an MP system, the BIOS must display the following message:

```
***** Warning: non-MP Processor *****
```

The processor(s) installed in your system are not multiprocessing capable. Now your system will halt.

If all processors have adequate multiprocessing capability for a DP or an MP system, but have different model numbers or operate at different frequencies, see [2.5.2.3 \[Mixed Frequency and Power P-state Configuration\]](#).

### 2.3.5 SLIT and SRAT

The System Locality Distance Information Table (SLIT) and System Resource Affinity Table (SRAT) are described in the *Advanced Configuration and Power Interface Specification*.

### 2.3.5.1 SLIT

The SLIT table is programmed with the following requirements:

- The local node in the SLIT table is 10.
- For fully connected system topologies, the remaining table entries are 16. A fully connected system topology is one where the number of hops between any two nodes in the system is one.
- For system topologies that are not fully connected:
  - If probe filter is enabled (**PrbFltrEn**), remaining table entries are programmed with the formula  $10 + \text{num\_hops} * 6$ .
  - If probe filter is disabled ( $\sim \text{PrbFltrEn}$ ), remaining table entries are programmed such that the maximum hop entries have a value of 13 and all other entries have 10.

Consider the 8 node system topology in [Figure 4](#). The maximum number of hops between any two nodes is 3. [Table 5](#) and [Table 6](#) show the SLIT table entries without probe filter and with probe filter. The values are normalized latencies and not absolute latencies. The raw latency of a system without the probe filter enabled is higher than one with the probe filter enabled.

**Figure 4: Example 8-Node System in Twisted Ladder Topology**

**Table 5: SLIT Table Without Probe Filter**

| Node | 0  | 1  | 2  | 3  | 4  | 5  | 6  | 7  |
|------|----|----|----|----|----|----|----|----|
| 0    | 10 | 10 | 10 | 10 | 10 | 13 | 10 | 13 |
| 1    | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| 2    | 10 | 10 | 10 | 10 | 10 | 13 | 10 | 13 |
| 3    | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| 4    | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| 5    | 13 | 10 | 13 | 10 | 10 | 10 | 10 | 10 |
| 6    | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| 7    | 13 | 10 | 13 | 10 | 10 | 10 | 10 | 10 |

**Table 6: SLIT Table With Probe Filter**

| Node | 0  | 1  | 2  | 3  | 4  | 5  | 6  | 7  |
|------|----|----|----|----|----|----|----|----|
| 0    | 10 | 16 | 16 | 22 | 22 | 28 | 22 | 28 |
| 1    | 16 | 10 | 22 | 22 | 16 | 22 | 16 | 22 |
| 2    | 16 | 22 | 10 | 16 | 22 | 28 | 22 | 28 |
| 3    | 22 | 22 | 16 | 10 | 16 | 22 | 16 | 22 |
| 4    | 22 | 16 | 22 | 16 | 10 | 16 | 22 | 22 |

**Table 6: SLIT Table With Probe Filter**

| Node | 0  | 1  | 2  | 3  | 4  | 5  | 6  | 7  |
|------|----|----|----|----|----|----|----|----|
| 5    | 28 | 22 | 28 | 22 | 16 | 10 | 22 | 16 |
| 6    | 22 | 16 | 22 | 16 | 22 | 22 | 10 | 16 |
| 7    | 28 | 22 | 28 | 22 | 22 | 16 | 16 | 10 |

### 2.3.5.2 SRAT

A unique proximity domain is assigned for each node in the system. A processor local APIC affinity structure is created such that all cores in a node are assigned the same proximity domain as the node. The base address and length of the memory attached to the node is programmed into a memory affinity structure. See the *Advanced Configuration and Power Interface Specification* for additional information. The SRAT does not need to be created if node interleaving is enabled. See 2.10.6.3 [Node Interleaving].

## 2.4 Processor Core

The majority of the behavioral definition of the core is specified in the AMD64 Architecture Programmer's Manual. See 1.2 [Reference Documents].

### 2.4.1 Compute Unit

Unless otherwise specified the processor configuration interface hides the compute unit implementation and presents software with homogenous cores, each independent of the other.

Software may use D18F5x80[Enabled, DualCore] in order to associate a core with a compute unit. This information can be useful because some configuration settings are determined based on active compute units and core performance may vary based on resource sharing within a compute unit.

**Table 7: Compute Unit Definitions**

| Term                        | Definition   |
|-----------------------------|--|
| <b>NumOfCompUnitsOnNode</b> | The number of compute units on a node for which at least 1 core is enabled. NumOfCompUnitsOnNode = COUNT(D18F5x80[Enabled]). |
| <b>DualCoreEnabled</b>      | Both cores of a compute unit are enabled. DualCoreEnabled = (D18F5x80[DualCore[0]]==1). 0=Core 0 enabled, Core 1 disabled.   |

#### 2.4.1.1 Registers Shared by Cores in a Compute Unit

Some MSRs are implemented one copy per compute unit instead of per core; these MSRs are designated as **SharedC** (shared coherent) or **SharedNC** (shared non-coherent). The absence of **SharedC/SharedNC** implies not-shared, which is the normal per-core instance programming model for RDMSR/WRMSR.

Programming rules for **SharedC** and **SharedNC** registers:

- Software must ensure that a shared MSR written by one core on a compute unit will not cause a problem for software that is running on the other core of the compute unit.
- **SharedC**: A write to a **SharedC** MSR does not have to be written to the other core of the compute unit in order for the other core to see the updated value.
- **SharedNC**: A write to a **SharedNC** MSR has to be written to both cores of the compute unit in order for both cores to see the updated value.

- If software can know that the other core has not read the [SharedNC](#) MSR since the last warm reset, then a write is not needed to the [SharedNC](#) MSR on the other core.
- Software may not rely on the other core maintaining the previous value of the [SharedNC](#) MSR.
- The [SharedNC](#) MSRs are: [MSRC001\\_00\[35:30\]](#), [MSRC001\\_00\[53:50\]](#), [MSRC001\\_0054](#), [MSRC001\\_0055](#).
- A read-modify-write of a shared MSR register is not atomic. Software must ensure atomicity between the cores that could simultaneously read-modify-write the shared register.

The [SharedC](#) and [SharedNC](#) MSR's are listed as follows:

**Table 8: SharedC and SharedNC MSR's**

| Register  | Shared   |
|---|----------|
| <a href="#">MSR0000_020[F:0]</a> [Variable-Size MTRRs Base/Mask]                        | SharedC  |
| <a href="#">MSR0000_02[6F:68,59:58,50]</a> [Fixed-Size MTRRs]                           | SharedC  |
| <a href="#">MSR0000_02FF</a> [MTRR Default Memory Type (MTRRdefType)]                   | SharedC  |
| <a href="#">MSR0000_0404</a> [IF Machine Check Control (MC1_CTL)]                       | SharedC  |
| <a href="#">MSR0000_0408</a> [CU Machine Check Control (MC2_CTL)]                       | SharedC  |
| <a href="#">MSR0000_0418</a> [FP Machine Check Control (MC6_CTL)]                       | SharedC  |

| <a href="#">MSRC001_102B</a> [Combined Unit Configuration 3 (CU_CFG3)]                  | SharedC  |

## 2.4.2 Virtual Address Space

The processor supports 48 address bits of virtual memory space (256 TB) as indicated by [CPUID Fn8000\\_0008\\_EAX](#).

## 2.4.3 Processor Cores and Downcoring

Each node supports downcoring as follows:

- The number of cores supported by a node is specified by [D18F5x84\[CmpCap\]](#).
- The cores of a compute unit may be software downcored by [D18F3x190\[DisCore\]](#) if ([DualCoreEnabled](#)==1). If ([DualCoreEnabled](#)==0) then the cores of a compute unit may not be software downcored. See [2.4.3.1 \[Software Downcoring using D18F3x190\[DisCore\]\]](#).
  - Both cores of a compute unit must be downcored if either core needs to be downcored.
  - The cores of a compute unit are even core x and odd core x+1. Clocks are turned off and power is gated to downcored compute units. The power savings is the same as CC6.
  - There must be at least 1 compute unit enabled on each node.
  - For dual-node processors, the number of cores enabled (not downcored) in each internal node must be the same. See [D18F3xE8\[IntNodeNum\]](#) for how to identify the internal nodes in a dual-node processor. The specific cores enabled in each internal node do not need to be the same, only the total number of cores in each internal node.
  - BIOS should configure all processors in a system to have the same number of enabled cores.
  - [D18F3x190\[DisCore\]](#) affects the value of [CPUID Fn8000\\_0008\\_ECX\[NC\]](#), [D18F5x80\[Enabled, Dual-Core\]](#). [D18F3x190\[DisCore\]](#) does not affect the value of [D18F5x84\[CmpCap\]](#).
- An implemented (physical) core that is downcored is not visible to software. Cores that are not downcored are numbered logically in a contiguous manner.
- [D18F5x80 \[Compute Unit Status\]](#) reports core topology information to software.
- The number of cores specified in [CPUID Fn8000\\_0008\\_ECX\[NC\]](#) must be the same as the number of cores enabled in [D18F0x1DC\[CpuEn\]](#).
- The core number, *CpuCoreNum*, is provided to SW running on each core through [CPUID Fn0000\\_0001\\_EBX\[LocalApicId\]](#) and [APIC20\[ApicId\]](#); *CpuCoreNum* also affects [D18F0x1DC\[CpuEn\]](#). *CpuCoreNum*, varies as the lowest integers from 0 to [D18F5x84\[CmpCap\]](#), based on the number of enabled cores; e.g., a 4-core node with 1 core disabled results in cores reporting *CpuCoreNum* values of 0, 1, and 2 regardless of which core is disabled. The boot core is always the core reporting *CpuCoreNum*=0.
- In dual-node processors, the *CpuCoreNum* assignments are described as follows. [CPUID Fn8000\\_0008\\_ECX\[NC\]](#)+1 is the number of cores in the processor. [D18F3xE8\[IntNodeNum\]](#) specifies the internal node number. Cores 0 through (NC+1)/2-1 are assigned to internal node 0 and cores (NC+1)/2 through NC are assigned to internal node 1.

Some legacy operating systems do not support processors with a non-power-of-2 number of cores. The BIOS should support a user configurable option to disable cores down to a power-of-2 number of cores for legacy operating system support.

### 2.4.3.1 Software Downcoring using D18F3x190[DisCore]

Cores may be downcored by [D18F3x190\[DisCore\]](#).

[D18F3x190\[DisCore\]](#) programming rules:

- Setting bits corresponding to cores that are not present results in undefined behavior.
- Once a core has been removed by [D18F3x190\[DisCore\]](#)=1, it cannot be added back without a cold reset. E.g. Software may only set *DisCore* bits, never clear them.
- Software may remove cores only once. If software removes cores by setting [D18F3x190\[DisCore\]](#)=1,

then software is not allowed to disable additional cores after the next warm reset.

- The most significant bit N is (the number of cores on the node)-1 at cold reset; the number of cores on the node at cold reset is (([CPUID Fn8000\\_0008\\_ECX\[NC\]+1](#))/(the number of nodes on the processor)); See [D18F3xE8\[MultiNodeCpu\]](#).
- The most significant bit N and the core ID significance of DisCore is not affected by the value of DisCore followed by a warm-reset.
  - E.g. If core 2 is disabled by DisCore[3:0]=0100b followed by a warm reset, then the new core 2 is the old core 3. If the new core 2 needs to then be disabled then DisCore[3:0]=1100b followed by a warm reset.
- All bits greater than bit N are reserved.
- If [D18F3x190\[DisCore\]](#) is changed, then the following need to be updated:
  - [D18F0x60\[CpuCnt\[4:0\]\]](#), [D18F0x160\[CpuCnt\[7:5\]\]](#).
  - [D18F3x1A0\[L3FreeListCBC\]](#). Note that L3FreeListCBC is Reset-applied.
  - [D18F5x170\[NbPstateThreshold\]](#)
  - [MSRC001\\_102A\[ThrottleNbInterface\]](#)

#### 2.4.4 Physical Address Space

The processor supports 48 address bits of coherent memory space (256 terabytes) as indicated by [CPUID Fn8000\\_0008\\_EAX \[Long Mode Address Size Identifiers\]](#). The processor master aborts the following upper-address transactions (to address PhysAddr):

- IO link requests with non-zero PhysAddr[63:48].
- IO link or CPU requests with non-zero PhysAddr[47:40] where [D18F0x68\[CHtExtAddrEn\]=0](#).
- IO link or CPU requests with non-zero PhysAddr[47:40] which targets an IO link for which the appropriate [D18F0x\[E4,C4,A4,84\]\[Addr64BitEn\]=0](#).
- IO link requests with non-zero PhysAddr[47:40] received from an IO link for which the appropriate [D18F0x\[E4,C4,A4,84\]\[Addr64BitEn\]=0](#).

#### 2.4.5 System Address Map

System software must not map memory in the reserved HyperTransport™ address regions. The link specification details the address map available to system hosts and devices. Downstream host accesses to reserved HyperTransport™ address regions result in a page fault, whether in real mode or protected mode. Upstream system device accesses to reserved HyperTransport™ address regions result in undefined operation.

##### 2.4.5.1 Memory Access to the Physical Address Space

All memory accesses to the physical address space from a core are sent to its associated northbridge (NB). All memory accesses from an IO link are routed through the NB. An IO link access to physical address space indicates to the NB the cache attribute (Coherent or Non-coherent, based on bit[0] of the Sized Read and Write commands).

A core access to physical address space has two important attributes that must be determined before issuing the access to the NB: the memory type (e.g., WB, WC, UC; as described in the MTRRs) and the access destination (DRAM or MMIO).

This mechanism is managed by the BIOS and does not require any setup or changes by system software.

##### 2.4.5.1.1 Determining Memory Type

The memory type for a core access is determined by the highest priority of the following ranges that the access falls in: 1==Lowest priority.

1. The memory type as determined by architectural mechanisms.
  - See the APM2 chapter titled “Memory System”, sections “Memory-Type Range Registers” and “Page-Attribute Table Mechanism”.
  - See the APM2 chapter titled “Nested Paging”, section “Combining Memory Types, MTRRs”.
  - See [MSR0000\\_02FF \[MTRR Default Memory Type \(MTRRdefType\)\]](#), [MSR0000\\_020\[F:0\] \[Variable-Size MTRRs Base/Mask\]](#), [MSR0000\\_02\[6F:68,59:58,50\] \[Fixed-Size MTRRs\]](#).
2. TSeg & ASeg SMM mechanism. (see [MSRC001\\_0112](#) and [MSRC001\\_0113](#))
3. CR0[CD]: If (CR0[CD]==1) then MemType=CD.
4. MMIO config space, APIC space.
  - MMIO APIC space and MMIO config space must not overlap.
  - MemType=UC.
  - See [2.4.8.1.2 \[APIC Register Space\]](#) and [2.8 \[Configuration Space\]](#).

#### 2.4.5.1.2 Determining The Access Destination for Core Accesses

The access destination, DRAM or MMIO, is based on the highest priority of the following ranges that the access falls in: 1==Lowest priority.

1. RdDram/WrDram as determined by [MSRC001\\_001A \[Top Of Memory \(TOP\\_MEM\)\]](#) and [MSRC001\\_001D \[Top Of Memory 2 \(TOM2\)\]](#).
2. The IORRs. (see [MSRC001\\_00\[18,16\]](#) and [MSRC001\\_00\[19,17\]](#)).
3. The fixed MTRRs. (see [MSR0000\\_02\[6F:68,59:58,50\] \[Fixed-Size MTRRs\]](#))
4. TSeg & ASeg SMM mechanism. (see [MSRC001\\_0112](#) and [MSRC001\\_0113](#))
5. MMIO config space, APIC space.
  - MMIO APIC space and MMIO config space must not overlap.
  - RdDram=IO, WrDram=IO.
  - See [2.4.8.1.2 \[APIC Register Space\]](#) and [2.8 \[Configuration Space\]](#).
6. NB address space routing. See [2.9.3.1.1 \[DRAM and MMIO Memory Space\]](#).

#### 2.4.6 Timers

Each core includes the following timers. These timers do not vary in frequency regardless of the current P-state or C-state.

- [MSR0000\\_0010 \[Time Stamp Counter \(TSC\)\]](#); the TSC increments at the rate specified by the P0 P-state; see [2.5.2.1.2.1 \[Software P-state Numbering\]](#) and [MSRC001\\_00\[6B:64\] \[P-state \[7:0\]\]](#).
- The APIC timer ([APIC380](#) and [APIC390](#)), which increments at the rate of CLKIN; the APIC timer may increment in units of between 1 and 8.

#### 2.4.7 Implicit Conditions for TLB Invalidation

The following family specific conditions will cause all TLB's for both cores of the compute unit to be invalidated; except [MSR0000\\_0277](#) which will only clear the TLB's for the core that did the MSR write. The architectural conditions that cause TLB invalidation are documented by the APM2 section titled “Translation-Lookaside Buffer (TLB)”; see “Implicit Invalidations”.

- [MSR0000\\_020\[F:0\] \[Variable-Size MTRRs Base/Mask\]](#)
- [MSR0000\\_02\[6F:68,59:58,50\] \[Fixed-Size MTRRs\]](#)
- [MSR0000\\_0277 \[Page Attribute Table \(PAT\)\]](#) (TLB's not cleared for the other core)
- [MSR0000\\_02FF \[MTRR Default Memory Type \(MTRRdefType\)\]](#)
- [MSRC001\\_0010 \[System Configuration \(SYS\\_CFG\)\]](#) write.
- [MSRC001\\_00\[18,16\] \[IO Range Base \(IORR\\_BASE\[1:0\]\)\]](#) write.
- [MSRC001\\_00\[19,17\] \[IO Range Mask \(IORR\\_MASK\[1:0\]\)\]](#) write.

- [MSRC001\\_001A \[Top Of Memory \(TOP\\_MEM\)\]](#) write.
- [MSRC001\\_001D \[Top Of Memory 2 \(TOM2\)\]](#) write.
- [MSRC001\\_1023 \[Combined Unit Configuration \(CU\\_CFG\)\]](#) write.
- [MSRC001\\_102A \[Combined Unit Configuration 2 \(CU\\_CFG2\)\]](#) write.
- [MSRC001\\_102B \[Combined Unit Configuration 3 \(CU\\_CFG3\)\]](#) write.

## 2.4.8 Interrupts

### 2.4.8.1 Local APIC

The local APIC contains logic to receive interrupts from a variety of sources and to send interrupts to other local APICs, as well as registers to control its behavior and report status. Interrupts can be received from:

- IO devices including the IO hub (IO APICs)
- Other local APICs (inter-processor interrupts)
- APIC timer
- Thermal events
- Performance counters
- Legacy local interrupts from the IO hub (INTR and NMI)
- APIC internal errors

The APIC timer, thermal events, performance counters, local interrupts, and internal errors are all considered local interrupt sources, and their routing is controlled by local vector table entries. These entries assign a message type and vector to each interrupt, allow them to be masked, and track the status of the interrupt.

IO and inter-processor interrupts have their message type and vector assigned at the source and are unaltered by the local APIC. They carry a destination field and a mode bit that together determine which local APIC(s) accepts them. The destination mode (DM) bit specifies if the interrupt request packet should be handled in physical or logical destination mode. If the destination field is FFh, the interrupt is broadcast and is accepted by all local APICs regardless of destination mode. If the destination field matches the broadcast value of FFh, then the interrupt is a broadcast interrupt and is accepted by all local APICs regardless of destination mode.

#### 2.4.8.1.1 Detecting and Enabling

APIC is detected and enabled via [CPUID Fn0000\\_0001\\_EDX\[APIC\]](#).

The local APIC is enabled via [MSR0000\\_001B\[ApicEn\]](#). Reset forces APIC disabled.

#### 2.4.8.1.2 APIC Register Space

MMIO APIC space:

- Memory mapped to a 4 KB range. The memory type of this space is the UC memory type. The base address of this range is specified by [{MSR0000\\_001B\[ApicBar\[47:12\]\],000h}](#).
- The mnemonic is defined to be APICXX; XX is the byte address offset from the base address.
- MMIO APIC registers in xAPIC mode is defined by the register from [APIC20](#) to [APIC\[530:500\]](#).
- Treated as normal memory space when APIC is disabled, as specified by [MSR0000\\_001B\[ApicEn\]](#).

#### 2.4.8.1.3 ApicId Enumeration Requirements

System hardware and BIOS must ensure that the number of cores per processor (NC) exposed to the operating system by all tables, registers, and instructions across all cores and processors in the system is identical.

See [2.4.10.1 \[Multi-Core Support\]](#) to derive NC.

Operating systems are expected to use `CPUID Fn8000_0008_ECX[ApicIdCoreIdSize]`, the number of least significant bits in the Initial APIC ID that indicate core ID within a processor, in constructing per-core CPUID masks. (`ApicIdCoreIdSize[3:0]` determines the maximum number of cores (MNC) that the processor could theoretically support, not the actual number of cores that are actually implemented or enabled on the processor, as indicated by `CPUID Fn8000_0008_ECX[NC]`.)  $MNC = (2 \wedge CPUID\ Fn8000\_0008\_ECX[ApicIdCoreIdSize])$ . BIOS must use the `ApicId MNC` rule when assigning `APIC20 [APIC ID][ApicId]` values as described below.

**ApicId MNC rule:** The `ApicId` of core *j* on processor *i* must be enumerated/assigned as:

- `ApicId[proc=i, core=j] = (OFFSET_IDX + i) * MNC + j`
- Where `OFFSET_IDX` is an integer offset (0 to N) used to shift up the core `ApicId` values to allow room for IOAPIC devices.

It is recommended that BIOS use the following APIC ID assignments for the broadest operating system support. Given  $N = (\text{Number\_Of\_Processors} * MNC)$  and  $M = \text{Number\_Of\_IOAPICs}$ :

- If  $(N+M) < 16$ , then assign the local (core) `ApicId`'s first from 0 to  $N-1$ , and the IOAPIC IDs from  $N$  to  $N+(M-1)$ . APIC ID 15 is reserved for broadcast when `APIC410[ExtApicIdEn]==0`.
- If  $(N+M) \geq 16$ , then assign the IOAPIC IDs first from 0 to  $M-1$ , and the local (core) `ApicId`'s from  $K$  to  $K+(N-1)$ , where  $K$  is an integer multiple of  $MNC$  greater than  $M-1$ .

For example, consider a 3 processor system where each processor has 3 cores and there are 8 IOAPIC devices. Each core can support an 8-bit `ApicId`. But if each IOAPIC device supports only a 4-bit IOAPIC ID, then the problem can be solved by shifting the core `ApicId` space to start at some integer multiple of  $MNC$ , such as offset 8 ( $MNC = 4$ ; `OFFSET_IDX=2`):

|   |   |
|---|---|
| <code>ApicId[proc=0,core=0] = (2+0)*4 + 0 = 0x08</code> | <code>ApicId[proc=1,core=2] = (2+1)*4 + 2 = 0x0E</code> |
| <code>ApicId[proc=0,core=1] = (2+0)*4 + 1 = 0x09</code> | <code>ApicId[proc=2,core=0] = (2+2)*4 + 0 = 0x10</code> |
| <code>ApicId[proc=0,core=2] = (2+0)*4 + 2 = 0x0A</code> | <code>ApicId[proc=2,core=1] = (2+2)*4 + 1 = 0x11</code> |
| <code>ApicId[proc=1,core=0] = (2+1)*4 + 0 = 0x0C</code> | <code>ApicId[proc=2,core=2] = (2+2)*4 + 2 = 0x12</code> |
| <code>ApicId[proc=1,core=1] = (2+1)*4 + 1 = 0x0D</code> |   |

#### 2.4.8.1.4 Physical Destination Mode

The interrupt is only accepted by the local APIC whose `APIC20[ApicId]` matches the destination field of the interrupt. Physical mode allows up to 255 APICs to be addressed individually.

#### 2.4.8.1.5 Logical Destination Mode

A local APIC accepts interrupts selected by `APICD0 [Logical Destination (LDR)]` and the destination field of the interrupt using either cluster or flat format as configured by `APICE0[Format]`.

If flat destinations are in use, bits 7-0 of `APICD0[Destination]` are checked against bits 7-0 of the arriving interrupt's destination field. If any bit position is set in both fields, the local APIC is a valid destination. Flat format allows up to 8 APICs to be addressed individually.

If cluster destinations are in use, bits 7-4 of `APICD0[Destination]` are checked against bits 7-4 of the arriving interrupt's destination field to identify the cluster. If all of bits 7-4 match, then bits 3-0 of `APICD0[Destination]` and the interrupt destination are checked for any bit positions that are set in both fields to identify processors within the cluster. If both conditions are met, the local APIC is a valid destination. Cluster format allows 15 clusters of 4 APICs each to be addressed.

#### 2.4.8.1.6 Interrupt Delivery

SMI, NMI, INIT, Startup, and External interrupts are classified as non-vectorized interrupts.

When an APIC accepts a non-vectorized interrupt, it is handled directly by the processor instead of being queued in the APIC. When an APIC accepts a fixed or lowest-priority interrupt, it sets the bit in [APIC\[270:200\] \[Interrupt Request \(IRR\)\]](#) corresponding to the vector in the interrupt. For local interrupt sources, this comes from the vector field in that interrupt's local vector table entry. The corresponding bit in [APIC\[1F0:180\] \[Trigger Mode \(TMR\)\]](#) is set if the interrupt is level-triggered and cleared if edge-triggered. If a subsequent interrupt with the same vector arrives when the corresponding bit in [APIC\[270:200\]\[RequestBits\]](#) is already set, the two interrupts are collapsed into one. Vectors 15-0 are reserved.

#### 2.4.8.1.7 Vectored Interrupt Handling

[APIC80 \[Task Priority \(TPR\)\]](#) and [APICA0 \[Processor Priority \(PPR\)\]](#) each contain an 8-bit priority divided into a main priority (bits 7-4) and a priority sub-class (bits 3-0). The task priority is assigned by software to set a threshold priority at which the processor is interrupted.

The processor priority is calculated by comparing the main priority (bits 7-4) of [APIC80\[Priority\]](#) to bits 7-4 of the 8-bit encoded value of the highest bit set in [APIC\[170:100\] \[In-Service \(ISR\)\]](#). The processor priority is the higher of the two main priorities.

The processor priority is used to determine if any accepted interrupts (indicated by [APIC\[270:200\]\[Request-Bits\]](#)) are high enough priority to be serviced by the processor. When the processor is ready to service an interrupt, the highest bit in [APIC\[270:200\]\[RequestBits\]](#) is cleared, and the corresponding bit is set in [APIC\[170:100\]\[InServiceBits\]](#).

When the processor has completed service for an interrupt, it performs a write to [APICB0 \[End of Interrupt\]](#), clearing the highest bit in [APIC\[170:100\]\[InServiceBits\]](#) and causing the next-highest interrupt to be serviced. If the corresponding bit in [APIC\[1F0:180\]\[TriggerModeBits\]](#) is set, a write to [APICB0](#) is performed on all APICs to complete service of the interrupt at the source.

#### 2.4.8.1.8 Interrupt Masking

Interrupt masking is controlled by the [APIC410 \[Extended APIC Control\]](#). If [APIC410\[IerCap\]](#) is set, [APIC\[4F0:480\] \[Interrupt Enable\]](#) are used to mask interrupts. Any bit in [APIC\[4F0:480\]\[InterruptEnableBits\]](#) that is clear indicates the corresponding interrupt is masked. A masked interrupt is not serviced and the corresponding bit in [APIC\[270:200\]\[RequestBits\]](#) remains set.

#### 2.4.8.1.9 Spurious Interrupts

In the event that the task priority is set to or above the level of the interrupt to be serviced, the local APIC delivers a spurious interrupt vector to the processor, as specified by [APICF0 \[Spurious-Interrupt Vector \(SVR\)\]](#). [APIC\[170:100\]](#) is not changed and no write to [APICB0](#) occurs.

#### 2.4.8.1.10 Spurious Interrupts Caused by Timer Tick Interrupt

A typical interrupt is asserted until it is serviced. An interrupt is deasserted when software clears the interrupt status bit within the interrupt service routine. Timer tick interrupt is an exception, since it is deasserted regardless of whether it is serviced or not.

The processor is not always able to service interrupts immediately (i.e. when interrupts are masked by clearing

EFLAGS.IM).

If the processor is not able to service the timer tick interrupt for an extended period of time, the INTR caused by the first timer tick interrupt asserted during that time is delivered to the local APIC in ExtInt mode and latched, and the subsequent timer tick interrupts are lost. The following cases are possible when the processor is ready to service interrupts:

- An ExtInt interrupt is pending, and INTR is asserted. This results in timer tick interrupt servicing. This occurs 50 percent of the time.
- An ExtInt interrupt is pending, and INTR is deasserted. The processor sends the interrupt acknowledge cycle, but when the PIC receives it, INTR is deasserted, and the PIC sends a spurious interrupt vector. This occurs 50 percent of the time.

There is a 50 percent probability of spurious interrupts to the processor.

#### 2.4.8.1.11 Lowest-Priority Interrupt Arbitration

Fixed, remote read, and non-vectored interrupts are accepted by their destination APICs without arbitration.

Delivery of lowest-priority interrupts requires all APICs to arbitrate to determine which one accepts the interrupt. If [APICF0\[FocusDisable\]](#) is clear, then the focus processor for an interrupt always accepts the interrupt. A processor is the focus of an interrupt if it is already servicing that interrupt (corresponding bit in [APIC\[170:100\]\[InServiceBits\]](#) is set) or if it already has a pending request for that interrupt (corresponding bit in [APIC\[270:200\]\[RequestBits\]](#) is set). If [APIC410\[IerCap\]](#) is set the interrupt must also be enabled in [APIC\[4F0:480\]\[InterruptEnableBits\]](#) for a processor to be the focus processor. If there is no focus processor for an interrupt, or focus processor checking is disabled, then each APIC calculates an arbitration priority value, stored in [APIC90 \[Arbitration Priority \(APR\)\]](#), and the one with the lowest result accepts the interrupt.

The arbitration priority value is calculated by comparing [APIC80\[Priority\]](#) with the 8-bit encoded value of the highest bit set in [APIC\[270:200\]\[RequestBits\]](#) (IRRVec) and the 8-bit encoded value of the highest bit set [APIC\[170:100\]\[InServiceBits\]](#) (ISRVec). If [APIC410\[IerCap\]](#) is set the IRRVec and ISRVec are based off the highest enabled interrupt. The main priority bits 7-4 are compared as follows:

If ([APIC80\[Priority\[7:4\]\]](#) >= IRRVec[7:4] and [APIC80\[Priority\[7:4\]\]](#) > ISRVec[7:4])

Then [APIC90\[Priority\]](#) = [APIC80\[Priority\]](#)

Else if (IRRVec[7:4] > ISRVec[7:4]) [APIC90\[Priority\]](#) = {IRRVec[7:4],0h}

Else [APIC90\[Priority\]](#) = {ISRVec[7:4],0h}

#### 2.4.8.1.12 Inter-Processor Interrupts

[APIC300 \[Interrupt Command Low \(ICR Low\)\]](#) and [APIC310 \[Interrupt Command High \(ICR High\)\]](#) provide a mechanism for generating interrupts in order to redirect an interrupt to another processor, originate an interrupt to another processor, or allow a processor to interrupt itself. A write to register [APIC300](#) causes an interrupt to be generated with the properties specified by the [APIC300](#) and [APIC310](#) fields.

#### 2.4.8.1.13 APIC Timer Operation

The local APIC contains a 32-bit timer, controlled by [APIC320 \[LVT Timer\]](#), [APIC380 \[Timer Initial Count\]](#), and [APIC3E0 \[Timer Divide Configuration\]](#). The processor bus clock is divided by the value in [APIC3E0\[Div\]](#) to obtain a time base for the timer. When [APIC380\[Count\]](#) is written, the value is copied into [APIC390 \[Timer Current Count\]](#). [APIC390\[Count\]](#) is decremented at the rate of the divided clock. When the count reaches 0, a

timer interrupt is generated with the vector specified in [APIC320\[Vector\]](#). If [APIC320\[Mode\]](#) specifies periodic operation, [APIC390\[Count\]](#) is reloaded with the [APIC380\[Count\]](#) value, and it continues to decrement at the rate of the divided clock. If [APIC320\[Mask\]](#) is set, timer interrupts are not generated.

#### 2.4.8.1.14 Generalized Local Vector Table

All LVTs ([APIC330](#) to [APIC3\[60:50\]](#), and [APIC\[530:500\]](#)) support a generalized message type as follows:

- 000b=Fixed
- 010b=SMI
- 100b=NMI
- 111b=ExtINT
- All other messages types are reserved.

#### 2.4.8.1.15 State at Reset

At power-up or reset, the APIC is hardware disabled ([MSR0000\\_001B\[ApicEn\]=0](#)) so only SMI, NMI, INIT, and ExtInt interrupts may be accepted.

The APIC can be software disabled through [APICF0\[APICSWEn\]](#). The software disable has no effect when the APIC is hardware disabled.

When a processor accepts an INIT interrupt, the APIC is reset as at power-up, with the exception that:

- [APIC20\[ApicId\]](#) is unaffected.
- Pending APIC register writes complete.

### 2.4.8.2 System Management Mode (SMM)

System management mode (SMM) is typically used for system control activities such as power management. These activities are typically transparent to the operating system.

#### 2.4.8.2.1 SMM Overview

SMM is entered by a core on the next instruction boundary after a system management interrupt (SMI) is received and recognized. A core may be programmed to broadcast a special cycle to the system, indicating that it is entering SMM mode. The core then saves its state into the SMM memory state save area and jumps to the SMI service routine (or SMI handler). The pointer to the SMI handler is specified by MSRs. The code and data for the SMI handler are stored in the SMM memory area, which may be isolated from the main memory accesses.

The core returns from SMM by executing the RSM instruction from the SMI handler. The core restores its state from the SMM state save area and resumes execution of the instruction following the point where it entered SMM. The core may be programmed to broadcast a special bus cycle to the system, indicating that it is exiting SMM mode.

#### 2.4.8.2.2 Operating Mode and Default Register Values

The software environment after entering SMM has the following characteristics:

- Addressing and operation is in Real mode.
  - A far jump, call or return in the SMI handler can only address the lower 1M of memory, unless the SMI handler first switches to protected mode.
  - If ([MSRC001\\_0111\[SmmBase\]](#) >= 0010\_0000h) then:
    - The value of the CS selector is undefined upon SMM entry.

- The undefined CS selector value should not be used as the target of a far jump, call, or return.
- 4-Gbyte segment limits.
- Default 16-bit operand, address, and stack sizes (instruction prefixes can override these defaults).
- Control transfers that do not override the default operand size truncate the EIP to 16 bits.
- Far jumps or calls cannot transfer control to a segment with a base address requiring more than 20 bits, as in Real mode segment-base addressing, unless a change is made into protected mode.
- A20M# is disabled. A20M# assertion or deassertion have no affect during SMM.
- Interrupt vectors use the Real mode interrupt vector table.
- The IF flag in EFLAGS is cleared (INTR is not recognized).
- The TF flag in EFLAGS is cleared.
- The NMI and INIT interrupts are masked.
- Debug register DR7 is cleared (debug traps are disabled).

The SMM base address is specified by [MSRC001\\_0111 \[SMM Base Address \(SMM\\_BASE\)\]](#)[SmmBase].

Important offsets to the base address pointer are:

- [MSRC001\\_0111](#)[SmmBase] + 8000h: SMI handler entry point.
- [MSRC001\\_0111](#)[SmmBase] + FE00h - FFFFh: SMM state save area.

#### 2.4.8.2.3 SMI Sources And Delivery

The processor accepts SMIs as link-defined interrupt messages only. The core/node destination of these SMIs is a function of the destination field of these messages. However, the expectation is that all such SMI messages are specified to be delivered globally (to all cores of all nodes).

There are also several local events that can trigger SMIs. However, these local events do not generate SMIs directly. Each of them triggers a programmable IO cycle that is expected to target the SMI command port in the IO hub and trigger a global SMI interrupt message back to the coherent fabric.

Local sources of SMI events that generate the IO cycle specified in [MSRC001\\_0056 \[SMI Trigger IO Cycle\]](#) are:

- In the core, as specified by:
  - [MSRC001\\_0022 \[Machine Check Exception Redirection\]](#).
  - [MSRC001\\_00\[53:50\] \[IO Trap \(SMI\\_ON\\_IO\\_TRAP\\_\[3:0\]\)\]](#).
- In the NB, as specified by:
  - [D18F3xB0 \[On-Line Spare Control\]](#).
  - [D18F3x160 \[NB Machine Check Misc \(DRAM Thresholding\) 0 \(MC4\\_MISC0\)\]](#).
- All local APIC LVT registers programmed to generate SMIs.

The status for these is stored in [SMMFEC4](#).

#### 2.4.8.2.4 SMM Initial State

After storing the save state, execution starts at [MSRC001\\_0111](#)[SmmBase] + 08000h. The SMM initial state is specified in the following table.

**Table 9: SMM Initial State**

| Register | SMM Initial State |
|----------|-------------------|
| CS       | SmmBase[19:4]     |
| DS       | 0000h             |
| ES       | 0000h             |

**Table 9: SMM Initial State**

| Register                  | SMM Initial State  |
|---------------------------|--|
| FS                        | 0000h  |
| GS                        | 0000h  |
| SS                        | 0000h  |
| General-Purpose Registers | Unmodified   |
| EFLAGS                    | 0000_0002h   |
| RIP                       | 0000_0000_0000_8000h   |
| CR0                       | Bits 0, 2, 3, and 31 cleared (PE, EM, TS, and PG); remainder is unmodified |
| CR4                       | 0000_0000_0000_0000h   |
| GDTR                      | Unmodified   |
| LDTR                      | Unmodified   |
| IDTR                      | Unmodified   |
| TR                        | Unmodified   |
| DR6                       | Unmodified   |
| DR7                       | 0000_0000_0000_0400h   |
| EFER                      | All bits are cleared except bit 12 (SVME) which is unmodified.             |

**2.4.8.2.5 SMM Save State**

In the following table, the offset field provides the offset from the SMM base address specified by [MSRC001\\_0111 \[SMM Base Address \(SMM\\_BASE\)\]](#).

**Table 10: SMM Save State**

| Offset | Size       | Contents |  | Access    |
|--------|------------|----------|--|-----------|
| FE00h  | Word       | ES       | Selector                               | Read-only |
| FE02h  | 6 Bytes    |          | Reserved                               |           |
| FE08h  | Quadword   |          | Descriptor in memory format            |           |
| FE10h  | Word       | CS       | Selector                               | Read-only |
| FE12h  | 6 Bytes    |          | Reserved                               |           |
| FE18h  | Quadword   |          | Descriptor in memory format            |           |
| FE20h  | Word       | SS       | Selector                               | Read-only |
| FE22h  | 6 Bytes    |          | Reserved                               |           |
| FE28h  | Quadword   |          | Descriptor in memory format            |           |
| FE30h  | Word       | DS       | Selector                               | Read-only |
| FE32h  | 6 Bytes    |          | Reserved                               |           |
| FE38h  | Quadword   |          | Descriptor in memory format            |           |
| FE40h  | Word       | FS       | Selector                               | Read-only |
| FE42h  | 2 Bytes    |          | Reserved                               |           |
| FE44h  | Doubleword |          | FS Base {16'b[47], 47:32} <sup>1</sup> |           |
| FE48h  | Quadword   |          | Descriptor in memory format            |           |

**Table 10: SMM Save State**

| Offset | Size       | Contents                              |  | Access     |

Notes:

1. This notation specifies that bit[47] is replicated in each of the 16 MSBs of the DW (sometimes called *sign extended*). The 16 LSBs contain bits[47:32].
2. Only used for an SMI in guest mode with nested paging enabled.

The SMI save state includes most of the integer execution unit. Not included in the save state are: the floating point state, MSRs, and CR2. In order to be used by the SMI handler, these must be saved and restored. The save state is the same, regardless of the operating mode (32-bit or 64-bit).

The following are some offsets in the SMM save state area. The mnemonic for each offset is in the form SMMxxxx, where xxxx is the offset in the save state.

### SMMFEC0 SMM IO Trap Offset

If the assertion of SMI is recognized on the boundary of an IO instruction, [SMMFEC0 \[SMM IO Trap Offset\]](#) contains information about that IO instruction. For example, if an IO access targets an unavailable device, the system can assert SMI and trap the IO instruction. [SMMFEC0](#) then provides the SMI handler with information about the IO instruction that caused the trap. After the SMI handler takes the appropriate action, it can reconstruct and then re-execute the IO instruction from SMM. Or, more likely, it can use [SMMFEC8 \[SMM IO Restart Byte\]](#), to cause the core to re-execute the IO instruction immediately after resuming from SMM.

| Bits  | Description  |
|-------|--|
| 31:16 | <b>Port: trapped IO port address.</b> Read-only. This provides the address of the IO instruction.  |
| 15:12 | <b>BPR: IO breakpoint match.</b> Read-only.  |
| 11    | <b>TF: EFLAGS TF value.</b> Read-only.   |
| 10:7  | Reserved   |
| 6     | <b>SZ32: size 32 bits.</b> Read-only. 1=Port access was 32 bits.   |
| 5     | <b>SZ16: size 16 bits.</b> Read-only. 1= Port access was 16 bits.  |
| 4     | <b>SZ8: size 8 bits.</b> Read-only. 1=Port access was 8 bits.  |
| 3     | <b>REP: repeated port access.</b> Read-only.   |
| 2     | <b>STR: string-based port access.</b> Read-only.   |
| 1     | <b>V: IO trap word valid.</b> Read-only. 1=The core entered SMM on an IO instruction boundary; all information in this offset is valid. 0=The other fields of this offset are not valid. |
| 0     | <b>RW: port access type.</b> Read-only. 0=IO write (OUT instruction). 1=IO read (IN instruction).  |

### SMMFEC4 Local SMI Status

This offset stores status bits associated with SMI sources local to the core. For each of these bits, 1=The associated mechanism generated an SMI.

| Bits  | Description  |
|-------|--|
| 31:23 | Reserved.  |
| 22    | <b>SmiSrcOnLineSpare: SMI source on-line spare.</b> Read-only. This bit is associated with the SMI sources specified in <a href="#">D18F3xB0 [On-Line Spare Control]</a> .   |
| 21    | Reserved.  |
| 20    | <b>SmiSrcThrCntL3: SMI source L3 cache thresholding.</b> Read-only. This bit is associated with the SMI source specified in the L3 cache thresholding register (see <a href="#">D18F3x160 [NB Machine Check Misc (DRAM Thresholding) 0 (MC4_MISC0)]</a> ). |
| 19    | <b>SmiSrcThrCntHt: SMI source link thresholding.</b> Read-only. This bit is associated with the SMI source specified in the link thresholding register (see <a href="#">D18F3x160 [NB Machine Check Misc (DRAM Thresholding) 0 (MC4_MISC0)]</a> ).         |
| 18    | <b>SmiSrcThrCntDram: SMI source DRAM thresholding.</b> Read-only. This bit is associated with the SMI source specified in the DRAM thresholding register (see <a href="#">D18F3x160 [NB Machine Check Misc (DRAM Thresholding) 0 (MC4_MISC0)]</a> ).       |
| 17    | <b>SmiSrcLvtExt: SMI source LVT extended entry.</b> Read-only. This bit is associated with the SMI sources specified in <a href="#">APIC[530:500] [Extended Interrupt [3:0] Local Vector Table]</a> .  |

|       |   |
|-------|---|
| 16    | <b>SmiSrcLvtLcy: SMI source LVT legacy entry.</b> Read-only. This bit is associated with the SMI sources specified by the non-extended LVT entries of the APIC.   |
| 15:11 | Reserved.   |
| 10    | <b>IntPendSmiSts: interrupt pending SMI status.</b> Read-only. This bit is associated with the SMI source specified in <a href="#">MSRC001_0055 [Interrupt Pending][IntPndMsg]</a> (when that bit is high).         |
| 9     | Reserved.   |
| 8     | <b>MceRedirSts: machine check exception redirection status.</b> Read-only. This bit is associated with the SMI source specified in <a href="#">MSRC001_0022 [Machine Check Exception Redirection][RedirSmiEn]</a> . |
| 7:4   | Reserved.   |
| 3:0   | <b>IoTrapSts: IO trap status.</b> Read-only. Each of these bits is associated with each of the respective SMI sources specified in <a href="#">MSRC001_00[53:50] [IO Trap (SMI_ON_IO_TRAP_[3:0])]</a> .             |

### SMMFEC8 SMM IO Restart Byte

00h on entry into SMM.

If the core entered SMM on an IO instruction boundary, the SMI handler may write this to FFh. This causes the core to re-execute the trapped IO instruction immediately after resuming from SMM. The SMI handler should only write to this byte if [SMMFEC0\[V\]=1](#); otherwise, the behavior is undefined.

If a second SMI is asserted while a valid IO instruction is trapped by the first SMI handler, the core services the second SMI prior to re-executing the trapped IO instruction. [SMMFEC0\[V\]=0](#) during the second entry into SMM, and the second SMI handler must not rewrite this byte.

If there is a simultaneous SMI IO instruction trap and debug breakpoint trap, the processor first responds to the SMI and postpones recognizing the debug exception until after resuming from SMM. If debug registers other than DR6 and DR7 are used while in SMM, they must be saved and restored by the SMI handler. If [SMMFEC8 \[SMM IO Restart Byte\]](#), is set to FFh when the RSM instruction is executed, the debug trap does not occur until after the IO instruction is re-executed.

| Bits | Description                                  |
|------|--|
| 7:0  | <b>RST: SMM IO Restart Byte.</b> Read-write. |

### SMMFEC9 Auto Halt Restart Offset

| Bits | Description   |
|------|---|
| 7:1  | Reserved.   |
| 0    | <b>HLT: halt restart.</b> Read-write. Upon SMM entry, this bit indicates whether SMM was entered from the Halt state. 0=Entered SMM on a normal x86 instruction boundary. 1=Entered SMM from the Halt state. Before returning from SMM, this bit can be written by the SMI handler to specify whether the return from SMM should take the processor back to the Halt state or to the instruction-execution state specified by the SMM state save area (normally, the instruction after the halt). 0=Return to the instruction specified in the SMM save state. 1=Return to the Halt state. If the return from SMM takes the processor back to the Halt state, the HLT instruction is not refetched and re-executed. However, the Halt special bus cycle is broadcast and the processor enters the Halt state. |

**SMMFECA NMI Mask**

| Bits | Description  |
|------|--|
| 7:1  | Reserved.  |
| 0    | <b>NmiMask</b> . Read-write. Specifies whether NMI was masked upon entry to SMM. 0=NMI not masked. 1=NMI masked. |

**SMMFED8 SMM SVM State**

Read-only. This offset stores the SVM state of the processor upon entry into SMM.

| Bits      | Description  |      |             |      |                                     |      |           |      |                                 |           |           |      |  |      |           |

**2.4.8.2.6 Exceptions and Interrupts in SMM**

When SMM is entered, the core masks INTR, NMI, SMI, INIT, and A20M interrupts. The core clears the IF flag to disable INTR interrupts. To enable INTR interrupts within SMM, the SMM handler must set the IF flag to 1. A20M is disabled so that address bit 20 is never masked when in SMM.

Generating an INTR interrupt can be used for unmasking NMI interrupts in SMM. The core recognizes the

assertion of NMI within SMM immediately after the completion of an IRET instruction. Once NMI is recognized within SMM, NMI recognition remains enabled until SMM is exited, at which point NMI masking is restored to the state it was in before entering SMM.

While in SMM, the core responds to the DBREQ and STPCLK interrupts, as well as to all exceptions that may be caused by the SMI handler.

#### 2.4.8.2.7 The Protected ASeg and TSeg Areas

These ranges are controlled by [MSRC001\\_0112](#) and [MSRC001\\_0113](#); see those registers for details.

#### 2.4.8.2.8 SMM Special Cycles

Special cycles can be initiated on entry and exit from SMM to acknowledge to the system that these transitions are occurring. These are controlled by [MSRC001\\_0015](#)[SMISPCYCDIS, RSMSPCYCDIS].

#### 2.4.8.2.9 Locking SMM

The SMM registers ([MSRC001\\_0112](#) and [MSRC001\\_0113](#)) are locked from being altered by setting [MSRC001\\_0015](#)[SmmLock]. SBIOS must lock the SMM registers after initialization to prevent unexpected changes to these registers.

#### 2.4.8.2.10 Synchronizing SMM Entry (Spring-Boarding)

The BIOS must take special care to ensure that all cores have entered SMM prior to accessing shared IO resources and all core SMI interrupt status bits are synchronized. This generally requires that BIOS waits for all cores to enter SMM.

The following conditions can cause one or more cores to enter SMM without all cores entering SMM:

- More than one IO device in the system is enabled to signal an SMI without hardware synchronization (e.g. using an end of SMI gate).
- A single device may signal multiple SMI messages without hardware synchronization (e.g. using an end of SMI gate).
- An SMI is received while one or more AP cores are in the INIT state. This may occur either during BIOS or secure boot.
- A hardware error prevents a core from entering SMM.

The act of synchronizing cores into SMM is called spring-boarding. Because not all of the above conditions can be avoided, it is recommended that all systems support spring-boarding.

An ACPI-compliant IO hub is required for spring-boarding. Depending on the IO hub design, BIOS may have to set additional end-of-SMI bits to trigger an SMI from within SMM.

The software requirements for the suggested spring-boarding implementation are listed as follows.

- A binary semaphore located in SMRAM, accessible by all cores. For the purpose of this discussion, the semaphore is called CheckSpringBoard. CheckSpringBoard is initialized to zero.
- Two semaphores located in SMRAM, accessible by all cores. For the purpose of this discussion, the semaphores are called NotInSMM and WaitInSMM. NotInSMM and WaitInSMM are initialized to a value equal to the number of cores in the system (NumCPUs).

The following BIOS algorithm describes spring-boarding and is optimized to reduce unnecessary SMI activity. This algorithm must be made part of the SMM instruction sequence for each core in the system.

1. Attempt to obtain ownership of the CheckSpringBoard semaphore with a read-modify-write instruction. If ownership was obtained then do the following, else proceed to step 2:
  - Check all enabled SMI status bits in the IO hub.  
Let  $\text{Status} = \text{enable1} \& \text{status1} \mid \text{enable2} \& \text{status2} \mid \text{enable3} \& \text{status3} \dots \text{enable } n \& \text{status } n$ .
  - If  $(\text{Status} == 0)$  then perform the following sub-actions.
    - Trigger an SMI broadcast assertion from the IO hub by writing to the software SMI command port.
    - Resume from SMM with the RSM instruction.

//Example:

```
InLineASM{
    BTS CheckSpringBoard,0; Try to obtain ownership of semaphore
    JC Step_2;
    CALL CheckIOHUB_SMIEVT; proc returns ZF=1 for no events
    JNZ Step_2;
    CALL Do_SpringBoard; Trigger SMI and then RSM
    Step_2:
}
```
2. Decrement the NotInSMM variable. Wait for  $(\text{NotInSMM} == 0)$ . See Note 1.
3. Execute the core-local event SMI handler. Using a third semaphore (not described here), synchronize core execution at the end of the task. After all cores have executed, proceed to step 4. The following is a brief description of the task for each core:
  - Check all enabled core-local SMI status bits in the core's private or MSR address space. Handle the event if possible, or pass information necessary to handle the event to a mailbox for the BSC to handle.
  - An exclusive mailbox must exist for each core for each core local event.
  - On-line spare events should be handled in this task by the individual core for optimal performance. Assign one core of a dual core processor to handle On-line spare. These events may be optionally handled by the BSC just as other global events.
  - Wait for all cores to complete this task at least once.
4. If the current core executing instructions is not the BSC then jump to step 5. If the core executing instructions is the BSC then jump to the modified main SMI handler task, described below.
  - Check all enabled SMI status bits in the IO hub. Check mailboxes for event status.
  - For each event, handle the event and clear the corresponding status bit.
  - Repeat until all enabled SMI status bits are clear and no mailbox events remain.
  - Set  $\text{NotInSMM} = \text{NumCPUs}$ . (Jump to step 5.)
5. Decrement the WaitInSMM variable. Wait for  $\text{WaitInSMM} = 0$ . See Note 2.
6. Increment the WaitInSMM variable. Wait for  $\text{WaitInSMM} = \text{NumCPUs}$ .
7. If the current processor core executing instructions is the BSC then reset CheckSpringBoard to zero.
8. Resume from SMM with the RSM instruction.

#### Notes:

1. To support a secure startup by the secure loader the BIOS must provide a timeout escape from the otherwise endless loop. The timeout value should be large enough to account for the latency of all cores entering SMM. The maximum SMM entrance latency is defined by the platform's IO sub-system, not the processor. A value of twice the watchdog timer count is recommended. See [D18F3x44 \[MCA NB Configuration\]](#) for more information on the watchdog time-out value.  
If a time-out occurs in the wait loop, the BIOS (the last core to decrement NotInSMM) should record the number of cores that have not entered SMM and all cores must fall out of the loop.
2. If a time-out occurs in the wait loop in step 2, the BIOS must not wait for  $\text{WaitInSMM} = 0$ . Instead it must wait for  $\text{WaitInSMM} = \text{"the number of cores recorded in step 2"}$ .

## 2.4.9 Secure Virtual Machine Mode (SVM)

Support for SVM mode is indicated by [CPUID Fn8000\\_0001\\_ECX\[SVM\]](#).

### 2.4.9.1 BIOS support for SVM Disable

The BIOS should include the following user setup options to enable and disable AMD Virtualization™ technology.

- Enable AMD Virtualization™.
  - [MSRC001\\_0114\[Svm\\_Disable\]](#) = 0.
  - [MSRC001\\_0114\[Lock\]](#) = 1.
  - [MSRC001\\_0118\[SvmLockKey\]](#) = 0000\_0000\_0000\_0000h.
- Disable AMD Virtualization™.
  - [MSRC001\\_0114\[Svm\\_Disable\]](#) = 1.
  - [MSRC001\\_0114\[Lock\]](#) = 1.
  - [MSRC001\\_0118\[SvmLockKey\]](#) = 0000\_0000\_0000\_0000h.

The BIOS may also include the following user setup options to disable AMD Virtualization™.

- Disable AMD Virtualization™, with a user supplied key.
  - [MSRC001\\_0114\[Svm\\_Disable\]](#) = 1.
  - [MSRC001\\_0114\[Lock\]](#) = 1.
  - [MSRC001\\_0118\[SvmLockKey\]](#) programmed with value supplied by user. This value should be stored in NVRAM.

## 2.4.10 CPUID Instruction

The CPUID instruction provides data about the features supported by the processor. See [3.10 \[CPUID Instruction Registers\]](#).

### 2.4.10.1 Multi-Core Support

There are two methods for determining multi-core support. A recommended mechanism is provided and a legacy method is also available for existing operating systems. System software should use the correct architectural mechanism to detect the number of physical cores by observing [CPUID Fn8000\\_0008\\_ECX\[NC\]](#). The legacy method utilizes the [CPUID Fn0000\\_0001\\_EBX\[LogicalProcessorCount\]](#).

### 2.4.10.2 L3 Cache Support

The NB includes an L3 cache.

BIOS must take steps to correctly display cache size information on the boot video screen:

- The total cache size is: ([CPUID Fn8000\\_0005\\_EDX\[L1IcSize\]](#)\*1 KB)+(CPUID [Fn8000\\_0005\\_ECX\[L1DcSize\]](#)\*1 KB)+(CPUID [Fn8000\\_0006\\_ECX\[L2Size\]](#)\*1 KB)+(CPUID [Fn8000\\_0006\\_EDX\[L3Size\]](#)\*512 KB).
- It is preferred that the BIOS shows the exact breakdown between the L1, L2, and L3 cache sizes and the total. For example, specify L1 (size of IC and DC in KB) + L2 (size of L2 in KB) + L3 (size of L3 in KB) = total cache size in KB.

## 2.5 Power Management

The processor supports many power management features in a variety of systems. [Table 11](#) provides a summary of ACPI states and power management features and indicates whether they are supported.

**Table 11: Power Management Support**

| ACPI/Power Management State                                  | Supported | Description   |
|--|-----------|---|
| G0/S0/C0: Working  | Yes       |   |
| G0/S0/C0: Core P-state transitions                           | Yes       | <a href="#">2.5.2 [P-states]</a>  |
| G0/S0/C0: NB P-state transitions                             | Yes       | <a href="#">2.5.2.2 [NB P-states]</a>                                   |
| G0/S0/C0: Hardware thermal control (HTC)                     | Yes       | <a href="#">2.11.2.1 [PROCHOT_L and Hardware Thermal Control (HTC)]</a> |
| G0/S0/C0: P-state limit control                              | Yes       | <a href="#">2.11.2.2 [Software P-state Limit Control]</a>               |
| G0/S0/C0: Thermal clock throttling (SMC controlled)          | No        |   |
| G0/S0/Per-core IO-based C-states                             | Yes       | <a href="#">2.5.3 [C-states]</a>  |
| G0/S0/C1: Halt   | Yes       |   |
| G0/S0/PC4: Altvid (VDD power plane)                          | No        |   |
| G0/S0/C5: Deeper altvid support (VDD power plane)            | No        |   |
| G0/S0/CC6: Power gating                                      | Yes       |   |
| G0/S0/C1E: Stop-grant caches not probed                      | Yes       |   |
| G0/S0/Cx: Cache flushing support                             | Yes       |   |
| G1/S1: Stand By (Powered On Suspend)                         | Yes       |   |
| G1/S3: Stand By (Suspend to RAM)                             | Yes       | <a href="#">2.5.5 [S-states]</a>  |
| G1/S4, S5: Hibernate (Suspend to Disk), Shut Down (Soft Off) | Yes       |   |
| G3 Mechanical Off  | Yes       |   |
| Parallel VID Interface                                       | No        | <a href="#">2.5.1 [Processor Power Planes And Voltage Control]</a>      |
| Serial VID Interface   | Yes       |   |
| Single-plane systems   | No        |   |
| Dual-plane systems   | Yes       |   |
| Triple-plane systems   | No        |   |

### 2.5.1 Processor Power Planes And Voltage Control

Refer to the processor electrical data sheet and infrastructure roadmap for power plan definitions. See [1.2 \[Reference Documents\]](#).

The voltage level of VDD and VDDNB may be altered in various states. All the other supplies are fixed.

The processor only supports dual-plane platforms. VDDNB is isolated from VDD on the systemboard and is controlled as a separate voltage plane.

#### 2.5.1.1 Internal VID Registers

The registers within the processor that contain VID fields all use 7-bit VID encodings. See the AMD Voltage Regulator Specification ([1.2 \[Reference Documents\]](#)).

- The VID for VDDNB is controlled by [D18F5x1\[6C:60\]\[NbVid\]](#). See [2.5.2.2.1 \[NB P-state Control\]](#).
- The VID for VDD is controlled by [MSRC001\\_00\[6B:64\]\[CpuVid\]](#) of the core in the highest-performance P-

state.

#### 2.5.1.1.1 VID Encodings

The VID encoding to VDD translations, for both the boot VID and the SVI VID, are defined by the AMD Voltage Regulator Specification (1.2 [Reference Documents]).

The boot VID is 1.0 volts.

#### 2.5.1.1.2 MinVid and MaxVid Check

Hardware limits the minimum and maximum VID code that is sent to the voltage regulator. The allowed limits of MinVid and MaxVid are provided in [MSRC001\\_0071](#). Prior to generating VID-change commands to SVI, the processor filters the InputVid value to the OutputVid as follows (higher VID codes correspond to lower voltages and lower VID codes correspond to higher voltages):

- If InputVid < MaxVid, OutputVid=MaxVid.
  - Else if (InputVid > MinVid) & (MinVid!=00h), OutputVid=MinVid.
  - Else OutputVid=InputVid.

This filtering is applied regardless of the source of the VID-change command.

#### 2.5.1.2 Serial VID Interface

The processor includes an interface, intended to control external voltage regulators, called the serial VID interface (SVI). The SVI encodes voltage regulator control commands, including the VID code, using SMBus protocol over two pins, SVD and SVC, to generate write commands to external voltage regulators. The processor is the master and the voltage regulator(s) are the slave(s). Both pins are outputs of the master; SVD is driven by the slave as well. SVC is a clock that strobes SVD, the data pin, on the rising edge. The frequency of the SVC is controlled by [D18F3xA0\[SviHighFreqSel\]](#). The SVI protocol is specified in the AMD Voltage Regulator Specification (1.2 [Reference Documents]).

#### 2.5.1.3 BIOS Requirements for Power Plane Initialization

- Configure [D18F3xD8\[VS RampSlamTime\]](#) based on the platform requirements.
- Configure [D18F3xD4\[PowerStepUp, PowerStepDown\]](#).
- Optionally configure [D18F3xA0\[PsiVidEn and PsiVid\]](#). Refer to 2.5.1.4.1 [PSI\_L Bit] for additional details.

#### 2.5.1.4 Low Power Features

##### 2.5.1.4.1 PSI\_L Bit

The processor supports indication of whether the processor is in a low-voltage state or not, which may be used by the regulator to place itself into a more power efficient mode. This is supported by the PSI\_L bit in the data field of the SVI command. The PSI\_L bit is enabled through [D18F3xA0\[PsiVidEn\]](#). The PSI\_L bit is asserted if the processor selects a VID code that is higher than or equal to (voltage that is lower than or equal to) the VID code specified in [D18F3xA0\[PsiVid\]](#). PSI\_L bit changes only occur on VID changes since it's part of the VID change command.

The voltage regulator must be able to supply the current required for the processor to operate at the VID code specified in [D18F3xA0\[PsiVid\]](#). [MSRC001\\_00\[6B:64\]\[IddValue, IddDiv\]](#) specify the maximum core current for each P-state. The following algorithm describes how to program PSI\_L on the core voltage planes.

```

After cold reset {
    If (PSI is supported on the platform) {
        PSI_vrm_current = current supported by the VDD voltage regulator when PSI is enabled
        PSI_inrush_current = inrush current on the VDD plane during a voltage transition
        Previous_voltage = 7Fh
        For (Pstate_number = 0; Pstate_number <= D18F3xDC[HwPstateMaxVal]; Pstate_number++) {
            Pstate_current = ProcIddMax for the Pstate specified by Pstate_number. See
                2.5.2.1.9 [Processor-Systemboard Power Delivery Compatibility Check].
            If ((Pstate_number+1) > D18F3xDC[HwPstateMaxVal])
                Next_Pstate_current = 0;
            Else Next_Pstate_current = PSI_inrush_current + ProcIddMax for the Pstate specified
                by Pstate_number+1. See 2.5.2.1.9 [Processor-Systemboard Power Delivery Compatibility Check].
            Pstate_voltage = MSRC001_00[6B:64][CpuVid] for the Pstate specified by Pstate_number
            If ((Pstate_current <= PSI_vrm_current) && (Next_Pstate_current <= PSI_vrm_current)
                && (Pstate_voltage != Previous_voltage)) {
                Set D18F3xA0[PsiVid] = Pstate_voltage
                Set D18F3xA0[PsiVidEn] = 1
                Break
            }
            Previous_voltage = Pstate_voltage
        }
    }
}

```

### 2.5.1.5 Voltage Transitions

The processor supports dynamic voltage transitions on the VDD and VDDNB planes. These transitions are controlled by either hardware or software. VDD and VDDNB voltage levels may be transitioned during state changes involving boot, reset, P-state changes, and C-state changes. In all cases, the voltage is *slammed*; this means that the VID code passed to the voltage regulator changes from the old value to the new value without stepping through intermediate values. The voltage regulator ramps the voltage directly from the starting voltage to the final voltage, no stepping occurs. See the AMD Voltage Regulator Specification, #40182 and D18F3xD8[VSRampSlamTime].

If a voltage increase is requested, the processor waits the amount of time specified by D18F3xD8[VSRampSlamTime] before sending any additional voltage change requests to the voltage regulator or before beginning a frequency transition. If a voltage decrease is requested, the processor waits the amount of time specified by D18F3xD8[VSRampSlamTime] before sending any additional voltage change requests to the voltage regulator. For voltage decreases, the processor does not wait any time before beginning frequency changes. The processor continues code execution during voltage changes when in the C0 state.

#### 2.5.1.5.1 Hardware-Initiated Voltage Transitions

When software requests a P-state change using MSRC001\_00[6B:64][PstateCmd] hardware coordinates the necessary voltage transitions. See 2.5.2 [P-states].

#### 2.5.1.5.2 Software-Initiated Voltage Transitions

The processor supports direct software VID control using MSRC001\_0070 [COFVID Control]. Hardware P-state transitions using MSRC001\_0062 [P-state Control] result in unpredictable behavior if software modifies the NbVid or CpuVid from the appropriate settings for the current P-state reported in MSRC001\_0063 [P-state Status].

### 2.5.1.5.2.1 Software-Initiated NB Voltage Transitions

To force VDDNB voltage changes, software must take the following steps:

1. Write the destination NbVid to [MSRC001\\_0070](#)[NbVid] on all cores on the node.
2. Wait the specified [D18F3xD8](#)[VSRampSlamTime] .

### 2.5.1.5.2.2 Software-Initiated Core Voltage Transitions

To force VDD voltage changes, software must take the following steps:

1. Write the destination CpuVid to [MSRC001\\_0070](#)[CpuVid].
2. Wait the specified [D18F3xD8](#)[VSRampSlamTime] .

## 2.5.2 P-states

P-states are operational performance states characterized by a unique frequency and voltage. P-states are numbered in ascending order starting with P0. P0 is the highest power, highest performance P-state; each ascending P-state number represents a lower-power, lower-performance P-state than the prior P-state number. As P-state numbers increase, the operating frequency and voltage for a given P-state must be less than or equal to the frequency and voltage of the prior P-state. At least one enabled core (P0) and NB P-state (NB P0) is specified for all processors.

The processor supports independently-controllable frequency planes for each compute unit and the NB; and independently-controllable voltage planes VDD and VDDNB. See [2.5.1 \[Processor Power Planes And Voltage Control\]](#) for voltage plane definitions.

The following terms may be applied to each of these planes:

- FID: frequency ID. Specifies the PLL frequency multiplier, relative to the reference clock, for a given domain.
- DID: divisor ID. Specifies the post-PLL power-of-two divisor that can be used to reduce the operating frequency.
- COF: current operating frequency. Specifies the operating frequency as a function of the FID and DID. Refer to [CoreCOF](#) for the CPU COF formula and [NBCOF](#) for the NB COF formula.
- VID: voltage ID. Specifies the voltage level for a given domain. Refer to [2.5.1.1.1 \[VID Encodings\]](#) for encodings.

All FID and DID parameters for software P-states must be programmed to equivalent values for all cores and NBs in the coherent fabric. See [2.5.2.1.2.1 \[Software P-state Numbering\]](#). Refer to [MSRC001\\_00\[6B:64\]](#) and [D18F5x1\[6C:60\]](#) for further details on programming requirements. Processors with different default P-state definitions can be mixed in a multi-socket system and still satisfy the FID and DID programming requirements. See [2.5.2.3 \[Mixed Frequency and Power P-state Configuration\]](#) for details on multi-socket, mixed-frequency and/or power initialization requirements.

### 2.5.2.1 Core P-states

The processor supports up to 8 core P-states (P0 through P7), specified in [MSRC001\\_00\[6B:64\]](#). Out of cold reset, the voltage and frequency of the cores is specified by [MSRC001\\_0071](#)[StartupPstate].

Support for dynamic core P-state changes is indicated by more than one enabled selection in [MSRC001\\_00\[6B:64\]](#)[PstateEn]. The FID, DID, and VID for each core P-state is specified in

[MSRC001\\_00\[6B:64\]](#). The COF for core P-states is a function of half the CLKIN frequency (nominally 100 MHz) and the DID. See [MSRC001\\_00\[6B:64\]\[CpuDid\]](#) for more details on the DID. Software requests core P-state changes independently using the hardware P-state control mechanism (a.k.a. fire and forget). See [2.5.4 \[Frequency and Voltage Domain Dependencies\]](#). Support for hardware P-state control is indicated by [CPUID Fn8000\\_0007\\_EDX\[HwPstate\]=1b](#). P-state transitions using the hardware P-state control mechanism are not allowed until the P-state initialization requirements defined in [2.5.2.1.8 \[BIOS Requirements for Core P-state Initialization and Transitions\]](#) are complete.

### 2.5.2.1.1 Application Power Management (APM)

Application Power Management (APM) allows the processor to deterministically provide maximum performance while remaining within the specified power delivery and removal envelope. APM dynamically monitors core activity and generates an approximation of power consumption. If power consumption exceeds a defined power limit, a P-state limit is applied by APM hardware to reduce power consumption. APM ensures that average power consumption over a thermally significant time period remains at or below the defined power limit. This allows P-states to be defined with higher frequencies and voltages than could be used without APM. These P-states are referred to as boosted P-states.

- APM consists of CPB and TDP limiting. See [2.5.2.1.1.1 \[TDP Limiting\]](#).
- APM is enabled if [D18F4x15C\[ApmMasterEn\]=1](#).
- Support for CPB is specified by [CPUID Fn8000\\_0007\\_EDX\[CPB\]](#).
- CPB is enabled if all of the following conditions are true:
  - [MSRC001\\_0015\[CpbDis\]==0](#) for all cores.
  - [D18F4x15C\[ApmMasterEn\]==1](#).
  - [D18F4x15C\[BoostSrc\]==01b](#).
  - [D18F4x15C\[NumBoostStates\]!=0](#).
- Boosted P-states can be dynamically enabled and disabled through [MSRC001\\_0015\[CpbDis\]](#). If core performance boost is disabled, a P-state limit is applied. The P-state limit restricts cores to the highest performance non-boosted P-state.
- APM monitors core activity at the ApmSampleTimer rate, which is specified by [D18F4x110\[CSampleTimer\]](#). See [D18F4x110\[CSampleTimer\]](#).
- All P-states, both boosted and non-boosted, are specified in [MSRC001\\_00\[6B:64\]](#).
- The number of boosted P-states is specified by [D18F4x15C\[NumBoostStates\]](#).
  - The number of boosted P-states may vary from product to product.
- Two levels of boosted P-states are supported. Compute units can be placed in the first level of boosted P-states if software requests the highest performance P-state available and processor power consumption remains within the TDP limit. The second level of boosted P-states can only be achieved if a subset of compute units are in CC6, software requests the highest performance P-state available, and the processor power consumption remains within the TDP limit. Compute units that are downcored do not count towards meeting the [D18F4x16C\[CstateCnt\]](#) requirements. See [D18F4x16C\[CstateCnt, CstateBoost\]](#) and [2.5.2.1.1.1 \[TDP Limiting\]](#).
- All boosted P-states are always higher performance than non-boosted P-states.
- To ensure proper operation, boosted P-states should be hidden from the operating system. BIOS should not provide ACPI \_PSS entries for boosted P-states. See [2.5.2.1.11.2 \[\\_PSS \(Performance Supported States\)\]](#).

#### 2.5.2.1.1.1 TDP Limiting

TDP limiting is a mechanism for capping the power consumption of the processor through a configurable TDP limit. APM varies the P-state limit of the processor to keep processor power consumption close to the TDP limit within a thermally significant period. See [2.5.2.1.1 \[Application Power Management \(APM\)\]](#). TDP limits can be set by BIOS or APML.

- TDP limiting is enabled if `D18F4x15C[ApmMasterEn]=1`.
- TDP limits are specified in units of power credits. One TDP unit equals one power credit. TDP units can be converted to watts by multiplying by the scaling factor `MSRC001_0077[Tdp2Watt]`.
- **APM** regulates the total processor core TDP. The maximum non-core TDP is specified by `D18F4x1B8[BaseTdp]`. The maximum processor TDP is specified by `D18F4x1B8[ProcessorTdp]`. The maximum total processor core TDP limit can be computed as `D18F4x10C[NodeTdpLimit] * (D18F3xE8[MultiNodeCpu] + 1)`.
- There are two sources of TDP limits in the processor. **APM** uses the lower of the two limits to determine the effective total core TDP limit for the processor.
  - The maximum sum of TDP for all cores on the processor is `D18F4x10C[NodeTdpLimit] * (D18F3xE8[MultiNodeCpu] + 1)`.
  - An APM defined percentage of the maximum processor TDP limit, `MSRC001_0075[ApmTdpLimitPercent]`.
- The highest performance P-state available to software varies with the TDP limit. See 2.5.2.1.1.2 [Notification of TDP Limit Changes] and 2.5.2.1.1 [Application Power Management (APM)].
- If software requests the highest performance P-state available and processor power consumption remains within the TDP limit, **APM** enables transitions to higher performance P-states.
- If processor power consumption exceeds the TDP limit, **APM** may restrict transitions to P-states that are lower performance than the software requested P-state.
- The effective total core TDP limit is equally divided between the two nodes on a multi-node processor.

### 2.5.2.1.1.2 Notification of TDP Limit Changes

APML or BIOS may set a TDP limit that results in limiting the number of P-states available to the OS. When this occurs, BIOS is notified of the new TDP limit via an SMI interrupt. See `D18F4x16C[ApmTdpLimitIntEn]`. In the interrupt routine, BIOS determines the highest performance P-state that satisfies the `D18F5xE8[ApmTdpLimit]` by performing the following algorithm on all cores of each node. The SMM BIOS should then notify the OS of the new P-state limit via an SCI interrupt.

1. All cores on a node must do the following before any core on the node can perform step 2:  
 $\text{SwPstateRequest} = \text{MSRC001\_0062}[\text{PstateCmd}]$ .
2. Only core 0 does the following before any core on the node can perform step 3:  
 $\text{BaseWatt (real number in W)} = ((\text{D18F4x1B8}[\text{BaseTdp}] * \text{D18F5xE8}[\text{Tdp2Watt}[15:0]])) / (2^{16})$ .  
 $\text{ApmWattLimit (real number in W)} = ((\text{D18F5xE8}[\text{ApmTdpLimit}] * \text{D18F5xE8}[\text{Tdp2Watt}[15:0]])) / (2^{16})$ .

```
IF (0 == MSRC001_00[6B:64][PstateEn] indexed by D18F3xDC[HwPstateMaxVal]) THEN
    D18F4x15C[TdpLimitPstate] = MSRC001_0061[PstateMaxVal] - 1.
ELSE
    D18F4x15C[TdpLimitPstate] = MSRC001_0061[PstateMaxVal].
ENDIF.
```

```
For (i=D18F4x15C[NumBoostStates]; i < D18F3xDC[HwPstateMaxVal]; i++) {
    PstateWatt[i] (real number in W) = (D18F2xF8[PwrValue[i]] * (D18F5x84[CmpCap] + 1)
        * (D18F3xE8[MultiNodeCpu] + 1)) / 10^D18F2xF8[PwrDiv[i]].
    IF ((PstateWatt[i] - BaseWatt) <= ApmWattLimit) THEN
        D18F4x15C[TdpLimitPstate] = i - D18F4x15C[NumBoostStates]
        Break.
    ENDIF.
}
```

3. All cores on a node must do the following:

`MSRC001_0062[PstateCmd] = SwPstateRequest.`

On multi-node processors:

- Both nodes must have the same number of enabled compute units and the number of enabled cores.
- `D18F4x15C[TdpLimitPstate]` must be the same on both nodes.

### 2.5.2.1.2 Core P-state Naming and Numbering

Since the number of boosted P-states may vary from product to product, the mapping between `MSRC001_00[6B:64]` and the indices used to request P-state changes or status also varies. In order to clarify this, two different numbering schemes are used.

#### 2.5.2.1.2.1 Software P-state Numbering

When referring to software P-state numbering, the following naming convention is used:

- Non-boosted P-states are referred to as P0, P1, etc.
  - P0 is the highest power, highest performance, non-boosted P-state.
  - Each ascending P-state number represents a lower-power, lower performance non-boosted P-state than the prior P-state number.
- Boosted P-states are referred to as Pb0, Pb1, etc.
  - Pb0 is the highest-performance, highest-power boosted P-state.
  - Each higher numbered boosted P-state represents a lower-power, lower-performance boosted P-state.

For example, if `D18F4x15C[NumBoostStates]` contains the values shown below, then the P-states would be named as follows:

**Table 12: Software P-state Naming**

| <code>D18F4x15C[NumBoostStates]=1</code> |                           | <code>D18F4x15C[NumBoostStates]=3</code> |                           |
|--|---------------------------|--|---------------------------|
| P-state Name                             | Corresponding MSR Address | P-state Name                             | Corresponding MSR Address |
| Pb0                                      | <code>MSRC001_0064</code> | Pb0                                      | <code>MSRC001_0064</code> |
| P0                                       | <code>MSRC001_0065</code> | Pb1                                      | <code>MSRC001_0065</code> |
| P1                                       | <code>MSRC001_0066</code> | Pb2                                      | <code>MSRC001_0066</code> |
| P2                                       | <code>MSRC001_0067</code> | P0                                       | <code>MSRC001_0067</code> |
| P3                                       | <code>MSRC001_0068</code> | P1                                       | <code>MSRC001_0068</code> |
| P4                                       | <code>MSRC001_0069</code> | P2                                       | <code>MSRC001_0069</code> |
| P5                                       | <code>MSRC001_006A</code> | P3                                       | <code>MSRC001_006A</code> |
| P6                                       | <code>MSRC001_006B</code> | P4                                       | <code>MSRC001_006B</code> |

All sections and register definitions use software P-state numbering unless otherwise specified.

#### 2.5.2.1.2.2 Hardware P-state Numbering

When referring to hardware P-state numbering, the following naming convention is used:

- All P-states are referred to as P0, P1, etc.
  - P0 is the highest power, highest-performance P-state, regardless of whether it is a boosted P-state or a

non-boosted P-state.

- Each ascending P-state number represents a lower-power, lower-performance P-state, regardless of whether it is a boosted P-state or not.

### 2.5.2.1.3 Core P-state Control

Core P-states are dynamically controlled by software and are exposed through ACPI objects (refer to [2.5.2.1.11 \[ACPI Processor P-state Objects\]](#)). Software requests a core P-state change by writing a 3 bit index corresponding to the desired P-state number to [MSRC001\\_0062\[PstateCmd\]](#) of the appropriate core. For example, to request P3 for core 0 software would write 011b to core 0's [MSRC001\\_0062\[PstateCmd\]](#). Boosted P-states may not be directly requested by software. Whenever software requests the P0 state on a processor that supports CPB (i.e. writes 000b to [MSRC001\\_0062\[PstateCmd\]](#)), hardware dynamically places the core into the highest-performance P-state possible as determined by APM. See [2.5.2.1.1 \[Application Power Management \(APM\)\]](#).

Hardware sequences the frequency and voltage changes necessary to complete a P-state transition as specified by [2.5.2.1.7 \[Core P-state Transition Behavior\]](#) with no additional software interaction required. Hardware also coordinates frequency and voltage changes when differing P-state requests are made on cores that share a frequency or voltage plane. See [2.5.4 \[Frequency and Voltage Domain Dependencies\]](#) for details about hardware coordination.

**Table 13: Software P-state Control**

| D18F4x15C[NumBoostStates]=1 |                                |                           | D18F4x15C[NumBoostStates]=3 |                                |                           |
|-----------------------------|--------------------------------|---------------------------|-----------------------------|--------------------------------|---------------------------|
| P-state Name                | Index Used for Requests/Status | Corresponding MSR Address | P-state Name                | Index Used for Requests/Status | Corresponding MSR Address |
| Pb0                         | n/a                            | MSRC001_0064              | Pb0                         | n/a                            | MSRC001_0064              |
| P0                          | 0                              | MSRC001_0065              | Pb1                         | n/a                            | MSRC001_0065              |
| P1                          | 1                              | MSRC001_0066              | Pb2                         | n/a                            | MSRC001_0066              |
| P2                          | 2                              | MSRC001_0067              | P0                          | 0                              | MSRC001_0067              |
| P3                          | 3                              | MSRC001_0068              | P1                          | 1                              | MSRC001_0068              |
| P4                          | 4                              | MSRC001_0069              | P2                          | 2                              | MSRC001_0069              |
| P5                          | 5                              | MSRC001_006A              | P3                          | 3                              | MSRC001_006A              |
| P6                          | 6                              | MSRC001_006B              | P4                          | 4                              | MSRC001_006B              |

Hardware controls the VID for each voltage domain according to the highest requirement of the frequency domain(s) on each plane. For example, the VID for a 4 compute unit dual-plane system must be maintained at the highest level required for all 4 frequency domains. The number of frequency domains in a voltage domain is package/platform specific. Refer to [2.5.2.1.7 \[Core P-state Transition Behavior\]](#) for details on hardware P-state voltage control. [2.5.1.3 \[BIOS Requirements for Power Plane Initialization\]](#) specifies the processor initialization requirements for voltage plane control.

### 2.5.2.1.4 Core P-state Visibility

[MSRC001\\_0063 \[P-state Status\]\[CurPstate\]](#) reflects the current non-boosted P-state number for each compute unit. For example, if [MSRC001\\_0063\[CurPstate\]](#)=010b on compute unit 1, then compute unit 1 is in the P2 state. If a compute unit is in a boosted P-state, [MSRC001\\_0063\[CurPstate\]](#) reads back as 0.

The voltage on a compute unit may not correspond to the VID code specified by the current P-state of the compute unit due to voltage plane dependencies. See [2.5.4 \[Frequency and Voltage Domain Dependencies\]](#). If a

compute unit is in the P0 state (i.e. if `MSRC001_0063[CurPstate]=0`), the frequency of the compute unit could be the frequency specified by P0 or any boosted P-state. To determine the frequency of a compute unit, see [2.5.6 \[Effective Frequency Interface\]](#).

#### 2.5.2.1.5 Core P-state Limits

Core P-states may be limited to lower-performance values under certain conditions, including:

- HTC. See [D18F3x64 \[Hardware Thermal Control \(HTC\)\]](#)[HtcPstateLimit].
- Software. See [D18F3x68](#)[SwPstateLimit].
- APM. See [D18F3xC4](#)[PstateLimit].
- Core Performance Boost. See [2.5.2.1.1 \[Application Power Management \(APM\)\]](#).
- PROCHOT\_L assertion. See [2.11.2.1 \[PROCHOT\\_L and Hardware Thermal Control \(HTC\)\]](#).

P-state limits are applied to all cores on the processor. The current P-state limit is provided in [MSRC001\\_0061](#)[CurPstateLimit]. Changes to the P-state limit can be programmed to trigger interrupts through [D18F3x64](#)[PslApicLoEn and PslApicHiEn]. In addition, the maximum P-state value, regardless of the source, is limited as specified in [MSRC001\\_0061](#)[PstateMaxVal].

#### 2.5.2.1.6 Core P-state Bandwidth Requirements

- The frequency relationship of (core COF / NB COF)  $\leq 4$  must be maintained for all supported P-state combinations. E.g., a core P0 COF of 4.0 GHz could not be combined with a NB P0 COF of 0.6 GHz; the NB P0 COF would have to be 1.0 GHz or greater; if the NB P0 COF is 1.0 GHz, then the NB P1 COF of 0.5 GHz may only be supported if the corresponding core P-state specify a COF of 2.0 GHz or less.
- All core P-states are required to be defined such that (NB COF/core COF)  $\leq 32$ , for all NB/core P-state combinations. E.g., if the NB COF is 4.8 GHz then the core COF must be no less than 150 MHz.
- All core P-states must be defined such that `CoreCOF`  $\geq 500$  MHz.
- All core P-states must be defined such that `CoreCOF`  $\neq 900$  MHz.
- NB COF  $\geq 2 * \text{MEMCLK}$  frequency. E.g., for DDR1333 support, NB COF must be 1.4 GHz or higher. (MEMCLK would be 667 MHz).
- NB COF  $\geq 800$  MHz.
- See [2.12.4 \[Link Bandwidth Requirements\]](#) for NB COF and link bandwidth requirements.

#### 2.5.2.1.7 Core P-state Transition Behavior

The following rules specify how P-states changes function and interact with other system or processor states:

- If the P-state number is increasing (the compute unit is moving to a lower-performance state), then the COF is changed first, followed by the VID change. If the P-state number is decreasing, then the VID is changed first followed by the COF.
- When the processor initiates a VID change that increases voltage for a voltage domain, no new voltage or frequency changes occur until [D18F3xD8](#)[VSRampSlamTime] has expired, regardless of whether any new requests are received. When the processor initiates a VID change that decreases voltage for a voltage domain, new voltage or frequency changes are allowed to occur immediately.
  - This is true regardless of whether the frequency or voltages changes occur as a result of P-state or C-state changes.
- If multiple commands are issued that affect the P-state of a domain prior to when the processor initiates the change of the P-state of that domain, then the processor operates on the last one issued.
- Once a P-state change starts, the P-state state machine (PSSM) continues through completion unless interrupted by a PWROK deassertion. If multiple P-state changes are requested concurrently, the PSSM may group the associated VID changes separately from the associated COF changes.

- Behavior during RESET\_L assertions:
  - All compute units are transitioned to C0.
  - If there is no P-state transition activity, then the compute units and NB remain in the current P-state. If a RESET\_L assertion interrupts a P-state transition, then the COF remains in its current state at the time RESET\_L is asserted (either the value of the old or the new P-state) and the VID remains in its current state (perhaps at a VID between the old and the new P-states, if the VID was being stepped). BIOS is required to transition to valid COF and VID settings after a warm reset according to the sequence defined in 2.5.2.1.10 [BIOS COF and VID Requirements After Warm Reset].
  - After a warm reset MSRC001\_0063 [P-state Status] is consistent with MSRC001\_0071[CurPstate]. MSRC001\_0062 [P-state Control] may not be consistent with MSRC001\_0071[CurPstate].
  - If D18F5x1[6C:60][NbFid] has changed, then the new value is applied to the NB PLL on the assertion of RESET\_L. It is assumed that BIOS adjusts the NB VID to the appropriate value prior to the warm reset. See 2.5.1.5.2 [Software-Initiated Voltage Transitions].
- The OS controls the P-state through MSRC001\_0062 [P-state Control], independent of P-state limits described in D18F3x64 [Hardware Thermal Control (HTC)][HtcPstateLimit], D18F3x68 [Software P-state Limit][StcPstateLimit], and D18F3xC4 [SBI P-state Limit]. P-state limits interact with OS-directed P-state transitions as follows:
  - Of all the active P-state limits, the one that represents the lowest-performance P-state number, at any given time, is treated as an upper limit on performance.
  - As the limit becomes active or inactive, or if it changes, the P-state for each compute unit is placed in either the last OS-requested P-state or the new limit P-state, whichever is a lower performance P-state number.
    - If the resulting P-state number exceeds MSRC001\_0061 [P-state Current Limit][PstateMaxVal], regardless of whether it is a limit or OS-requested, then the PstateMaxVal is used instead.

#### 2.5.2.1.8 BIOS Requirements for Core P-state Initialization and Transitions

1. Check that CPUID Fn8000\_0007\_EDX[HwPstate]=1. If not, P-states are not supported, no P-state related ACPI objects should be generated, and BIOS must skip the rest of these steps.
2. Program D18F3x[84:80] [ACPI Power State Control] based on BIOS recommendations.
3. Complete the 2.5.1.3 [BIOS Requirements for Power Plane Initialization].
4. Complete the 2.5.2.3.1 [Mixed Northbridge Frequency Configuration Sequence].
5. Transition all parts to the minimum performance P-state using the algorithm detailed in 2.5.2.1.10.2 [Core Minimum P-state Transition Sequence After Warm Reset].
6. Complete the 2.5.2.1.10.3 [NB COF and VID Transition Sequence After Warm Reset]. All cores on a processor must be in the minimum performance P-state prior to executing this sequence.
7. Complete the 2.5.2.1.9 [Processor-Systemboard Power Delivery Compatibility Check].
8. Determine the valid set of P-states:
  - Based on the sequence described in 2.5.2.3 [Mixed Frequency and Power P-state Configuration] for multi-processor systems.
  - Based on the enabled P-states indicated in MSRC001\_00[6B:64] [P-state [7:0]][PstateEn] for single-processor systems.
9. Transition all cores to the maximum performance P-state by writing 0 to MSRC001\_0062[PstateCmd].
10. If P-states are not supported, as indicated by only one enabled selection in MSRC001\_00[6B:64] [P-state [7:0]][PstateEn], then BIOS must not generate ACPI-defined P-state objects described in 2.5.2.1.11 [ACPI Processor P-state Objects]. Otherwise, the ACPI objects should be generated to enable P-state support.

#### 2.5.2.1.9 Processor-Systemboard Power Delivery Compatibility Check

BIOS must disable processor P-states that require higher power delivery than the systemboard can support. This power delivery compatibility check is designed to prevent system failures caused by exceeding the power

delivery capability of the systemboard for the power plane(s) that contain the core(s). Refer to 2.5.1 [Processor Power Planes And Voltage Control] for power plane definitions and configuration information. BIOS should perform this check independently for each node in the coherent fabric. BIOS can optionally notify the user if P-states are detected that exceed the systemboard power delivery capability. Modifications to MSRC001\_00[6B:64] [P-state [7:0]] must be applied equally to all cores on the same node. This check does not ensure functionality for all package/socket compatible processor/systemboard combinations.

MSRC001\_00[6B:64][PstateEn] must be set to 0 for any P-state MSR where PstateEn=1 and the processor current requirement (ProcIddMax), defined by the following equation, is greater than the systemboard current delivery capability.  $\text{ProcIddMax} = \text{MSRC001\_00[6B:64][IddValue]} * 1/10^{\text{MSRC001\_00[6B:64][IddDiv]}} * (\text{CPUID Fn8000\_0008\_ECX[NC]}+1)$  ;

The power delivery check should be applied starting with software P0 and continue with increasing P-state indexes (1, 2, 3, and 4) for all enabled P-states. The power delivery check does not need to be applied to boost P-states since APM ensures that the average current consumption over a thermally significant time period remains at or below TDC. Once a compatible software P-state is found using the ProcIddMax equation the check is complete. All processor P-states with higher indexes are defined to be lower power and performance, and are therefore compatible with the systemboard.

Example:

- MSRC001\_0065[IddValue] = 32d
- MSRC001\_0065[IddDiv] = 0d
- CPUID Fn8000\_0008\_ECX[NC] = 1d
- ProcIddMax =  $32 * 1 * 2 = 64\text{A}$  per plane

The systemboard must be able to supply  $\geq 64\text{A}$  per plane for the unified core power plane in order to support P1 for this processor. If the systemboard current delivery capability is  $< 64\text{A}$  per plane then BIOS must set MSRC001\_0065[PstateEn]=0 for all cores on this node, and continue by checking P2 in the same fashion.

If no P-states are disabled on a node while performing the power delivery compatibility check then BIOS does not need to take any action.

If at least one P-state is disabled on a node by performing the power delivery compatibility check and at least one P-state remains enabled for that node, then BIOS must perform the following steps:

1. If the P-state pointed to by MSRC001\_0063[CurPstate] is disabled by the power delivery compatibility check, then BIOS must request a transition to an enabled P-state using MSRC001\_0062[PstateCmd] and wait for MSRC001\_0063[CurPstate] to reflect the new value.
2. If software P0 is disabled, then disable all boosted P-states and program D18F4x15C[BoostSrc]=0.
3. Copy the contents of the enabled P-state MSRs (MSRC001\_00[6B:64]) to the highest performance P-state locations. E.g. if P0 and P1 are disabled by the power delivery compatibility check and P2 - P4 remain enabled, then the contents of P2 - P4 should be copied to P0 - P2 and P3 and P4 should be disabled (PstateEn=0). This step uses software P-state numbering. See 2.5.2.1.2.1 [Software P-state Numbering].
4. Request a P-state transition to the P-state MSR containing the COF/VID values currently applied. E.g. If MSRC001\_0063[CurPstate]=100b and P4 P-state MSR information is copied to P2 in step 2, then BIOS should write 010b to MSRC001\_0062[PstateCmd] and wait for MSRC001\_0063[CurPstate] to reflect the new value.
5. Adjust the following P-state parameters affected by the P-state MSR copy by subtracting the number of software P-states that are disabled by the power delivery compatibility check. This calculation should not wrap, but saturate at 0. E.g. if P0 and P1 are disabled, then each of the following register fields should have 2 subtracted from them:

- [D18F3x64](#)[HtcPstateLimit]
- [D18F3x68](#)[SwPstateLimit]
- [D18F3xDC](#)[HwPstateMaxVal]

If any node has all P-states disabled after performing the power delivery compatibility check, then BIOS must perform the following steps. This does not ensure operation and BIOS should notify the user of the incompatibility between the processor and systemboard if possible.

1. If [MSRC001\\_0063](#)[CurPstate] != [MSRC001\\_0061](#)[PstateMaxVal], then write [MSRC001\\_0061](#)[PstateMaxVal] to [MSRC001\\_0062](#)[PstateCmd] and wait for [MSRC001\\_0063](#)[CurPstate] to reflect the new value.
2. If [MSRC001\\_0061](#)[PstateMaxVal] != 000b copy the contents of the P-state MSR pointed to by [MSRC001\\_0061](#)[PstateMaxVal] to the P0 MSR and set PstateEn=1 for the P0 MSR; Write 000b to [MSRC001\\_0062](#)[PstateCmd] and wait for [MSRC001\\_0063](#)[CurPstate] to reflect the new value. This step uses software P-state numbering. See [2.5.2.1.2.1 \[Software P-state Numbering\]](#).
3. Adjust the following fields to [D18F4x15C](#)[NumBoostStates].
  - [D18F3x64](#)[HtcPstateLimit]
  - [D18F3x68](#)[SwPstateLimit]
  - [D18F3xDC](#)[HwPstateMaxVal]
4. Program [D18F4x15C](#)[BoostSrc]=0.

#### 2.5.2.1.10 BIOS COF and VID Requirements After Warm Reset

Warm reset is asynchronous and can interrupt P-state transitions leaving the processor in a VID state that does not correspond to [MSRC001\\_0063](#)[CurPstate] on any core. The processor frequency after warm reset corresponds to [MSRC001\\_0063](#)[CurPstate]. See [2.5.2.1.7 \[Core P-state Transition Behavior\]](#) for P-state transition behavior when RESET\_L is asserted. BIOS is required to transition the processor to valid COF and VID settings corresponding to an enabled P-state following warm reset. The cores may be transitioned to either the maximum or minimum P-state COF and VID settings using the sequences defined in [2.5.2.1.10.1 \[Core Maximum P-state Transition Sequence After Warm Reset\]](#) and [2.5.2.1.10.2 \[Core Minimum P-state Transition Sequence After Warm Reset\]](#). Transitioning to the minimum P-state after warm reset is recommended to prevent undesired system behavior if a warm reset occurs before the [2.5.2.1.9 \[Processor-Systemboard Power Delivery Compatibility Check\]](#) is complete. For processors that support NB P-states, BIOS must also transition NB COF and VID settings after warm reset using the sequence defined in [2.5.2.1.10.3 \[NB COF and VID Transition Sequence After Warm Reset\]](#).

##### 2.5.2.1.10.1 Core Maximum P-state Transition Sequence After Warm Reset

1. Write [MSRC001\\_0061](#)[PstateMaxVal] to [MSRC001\\_0062](#)[PstateCmd] on all cores in the processor.
2. Wait for [MSRC001\\_0071](#)[CurCpuFid, CurCpuDid] = [CpuFid, CpuDid] from [MSRC001\\_00\[6B:64\]](#) indexed by [D18F3xDC](#)[HwPstateMaxVal].
3. Step 2 must be completed on all cores prior to executing step 4 since a compute unit transitions to the highest performance P-state requested on either core.
4. Write 0 to [MSRC001\\_0062](#)[PstateCmd] on all cores in the processor.
5. Wait for [MSRC001\\_0071](#)[CurCpuFid, CurCpuDid] = [CpuFid, CpuDid] from [MSRC001\\_00\[6B:64\]](#) indexed by [MSRC001\\_0071](#)[CurPstateLimit].
6. If [MSRC001\\_0071](#)[CurPstateLimit] != [D18F3xDC](#)[HwPstateMaxVal], wait for [MSRC001\\_0071](#)[CurCpuVid] = [CpuVid] from [MSRC001\\_00\[6B:64\]](#) indexed by [MSRC001\\_0071](#)[CurPstateLimit].
7. Wait for [MSRC001\\_0063](#)[CurPstate] = [MSRC001\\_0061](#)[CurPstateLimit].

##### 2.5.2.1.10.2 Core Minimum P-state Transition Sequence After Warm Reset

1. Write 0 to [MSRC001\\_0062](#)[PstateCmd] on all cores in the processor.

2. Wait for `MSRC001_0071[CurCpuFid, CurCpuDid] = [CpuFid, CpuDid]` from `MSRC001_00[6B:64]` indexed by `MSRC001_0071[CurPstateLimit]` on all cores in the processor. All cores must complete this step before any core can proceed to the next step.
3. Write `MSRC001_0061[PstateMaxVal]` to `MSRC001_0062[PstateCmd]` on all cores in the processor.
4. Wait for `MSRC001_0071[CurCpuFid, CurCpuDid] = [CpuFid, CpuDid]` from `MSRC001_00[6B:64]` indexed by `D18F3xDC[HwPstateMaxVal]`.
5. If `MSRC001_0071[CurPstateLimit] != MSRC001_0071[CurPstate]`, wait for `MSRC001_0071[CurCpuFid, CurCpuDid] = [CpuFid, CpuDid]` from `MSRC001_00[6B:64]` indexed by `D18F3xDC[HwPstateMaxVal]`.
6. Wait for `MSRC001_0063[CurPstate] = MSRC001_0062[PstateCmd]`.

### 2.5.2.1.10.3 NB COF and VID Transition Sequence After Warm Reset

The following sequence must be performed on only one core per node.

1. `Temp1=D18F5x170[SwNbPstateLoDis]`.
2. `Temp2=D18F5x170[NbPstateDisOnP0]`.
3. `Temp3=D18F5x170[NbPstateThreshold]`.
4. If `MSRC001_0070[NbPstate]=0`, go to step 5. If `MSRC001_0070[NbPstate]=1`, go to step 9.
5. Write 0 to `D18F5x170[SwNbPstateLoDis, NbPstateDisOnP0, NbPstateThreshold]`.
6. Wait for `D18F5x174[CurNbPstate] = D18F5x170[NbPstateLo]` and `D18F5x174[CurNbFid, CurNbDid]=[NbFid, NbDid]` from `D18F5x1[6C:60]` indexed by `D18F5x170[NbPstateLo]`.
7. Set `D18F5x170[SwNbPstateLoDis]=1`.
8. Wait for `D18F5x174[CurNbPstate] = D18F5x170[NbPstateHi]` and `D18F5x174[CurNbFid, CurNbDid]=[NbFid, NbDid]` from `D18F5x1[6C:60]` indexed by `D18F5x170[NbPstateHi]`. Go to step 13.
9. Write 1 to `D18F5x170[SwNbPstateLoDis]`.
10. Wait for `D18F5x174[CurNbPstate] = D18F5x170[NbPstateHi]` and `D18F5x174[CurNbFid, CurNbDid]=[NbFid, NbDid]` from `D18F5x1[6C:60]` indexed by `D18F5x170[NbPstateHi]`.
11. Write 0 to `D18F5x170[SwNbPstateLoDis, NbPstateDisOnP0, NbPstateThreshold]`.
12. Wait for `D18F5x174[CurNbPstate] = D18F5x170[NbPstateLo]` and `D18F5x174[CurNbFid, CurNbDid]=[NbFid, NbDid]` from `D18F5x1[6C:60]` indexed by `D18F5x170[NbPstateLo]`.
13. Set `D18F5x170[SwNbPstateLoDis]=Temp1`, `D18F5x170[NbPstateDisOnP0]=Temp2`, and `D18F5x170[NbPstateThreshold]=Temp3`.

### 2.5.2.1.11 ACPI Processor P-state Objects

Processor performance control is implemented through the `_PCT`, `_PSS` and `_PSD` objects in ACPI 2.0 and later revisions. The presence of these objects indicates to the OS that the platform and processor are capable of supporting multiple performance states. Processor performance states are not supported with ACPI 1.0b. BIOS must provide the `_PCT`, `_PSS`, and `_PSD` objects, and define other ACPI parameters to support operating systems that provide native support for processor P-state transitions.

The following rules apply to BIOS generated ACPI objects in multi-core systems. Refer to the appropriate ACPI specification (<http://www.acpi.info>) for additional details:

- All cores must expose the same number of performance states to the OS.
- The respective performance states displayed to the OS for each core must have identical performance and power-consumption parameters (e.g. P0 on core 0 must have the same performance and power-consumptions parameters as P0 on core 1, P1 on core 0 must have the same parameters as P1 on core 1, however P0 can be different than P1).
- Performance state objects must be present under each processor object in the system.

### 2.5.2.1.11.1 \_PCT (Performance Control)

BIOS must declare the performance control object parameters as functional fixed hardware. This definition indicates the processor driver understands the architectural definition of the P-state interface associated with [CPUID Fn8000\\_0007\\_EDX\[HwPstate\]=1](#).

- Perf\_Ctrl\_Register = Functional Fixed Hardware
- Perf\_Status\_Register = Functional Fixed Hardware

### 2.5.2.1.11.2 \_PSS (Performance Supported States)

A unique \_PSS entry is created for each non-boosted P-state. See [2.5.2.1.2.1 \[Software P-state Numbering\]](#). BIOS must loop through each of [MSRC001\\_00\[6B:64\] \[P-state \[7:0\]\]](#) applying the formulas for CoreFreq and Power, and assigning Control and Status appropriately for valid P-states (PstateEn=1). BIOS should ignore [MSRC001\\_00\[6B:64\] \[P-state \[7:0\]\]](#) for boosted P-states. The TransitionLatency and BusMasterLatency values can be calculated once for each processor and applied to all \_PSS entries for cores on that processor.

The Control and Status fields for the highest performance non-boosted P-state must be programmed to 0. Each lower performance non-boosted P-state must have the Control and Status fields programmed in ascending order. The value contained in the Control field is written to [MSRC001\\_0062 \[P-state Control\]](#) to request a P-state change to the CoreFreq of the associated \_PSS object. The value in the Control field is a direct indication of the P-state register ([MSRC001\\_00\[6B:64\]](#)) that contains the COF and VID settings for the associated P-state. The value contained in [MSRC001\\_0063 \[P-state Status\]](#) can be used to identify the \_PSS object of the current P-state by equating [MSRC001\\_0063\[CurPstate\]](#) to the value of the Status field. Refer to [2.5.2 \[P-states\]](#) for further details on P-state definition and behavior.

- CoreFreq (MHz) = Calculated using the formula for [CoreCOF](#). All CoreFreq values must be rounded to the nearest 100 MHz frequency resulting in a maximum of 50 MHz frequency difference between the reported CoreFreq and calculated CPU COF.
- Power (mW)
  - Convert [MSRC001\\_00\[6B:64\]\[CpuVid\]](#) to a voltage by referring to the AMD Voltage Regulator Specification ([1.2 \[Reference Documents\]](#)).
  - Power (mW) = voltage \* [MSRC001\\_00\[6B:64\]\[IddValue\]](#) \* 1/10<sup>MSRC001\_00[6B:64][IddDiv]</sup> \* 1000
- TransitionLatency (us) and BusMasterLatency (us)
  - If [MSRC001\\_00\[6B:64\]\[CpuFid\]](#) is the same value for all P-states where [MSRC001\\_00\[6B:64\]\[PstateEn\]=1](#): TransitionLatency = BusMasterLatency = (15 steps \* [D18F3xD4\[PowerStepDown\]](#) ns/step / 1000 us/ns) + (15 steps \* [D18F3xD4\[PowerStepUp\]](#) ns/step / 1000 us/ns)
  - If [MSRC001\\_00\[6B:64\]\[CpuFid\]](#) is different for any P-states where [MSRC001\\_00\[6B:64\]\[PstateEn\]=1](#): TransitionLatency = BusMasterLatency = (15 steps \* [D18F3xD4\[PowerStepDown\]](#) ns/step / 1000 us/ns) + [D18F3xA0\[PllLockTime\]](#) us + (15 steps \* [D18F3xD4\[PowerStepUp\]](#) ns/step / 1000 us/ns)

Example:  
[MSRC001\\_00\[6B:64\]\[CpuFid\]](#) is not the same for all P-states  
[D18F3xD4\[PowerStepDown\]](#) = [D18F3xD4\[PowerStepUp\]](#) = 8h (50 ns/step)  
[D18F3xA0\[PllLockTime\]](#) = 001b (2 us)  
 TransitionLatency = BusMasterLatency = (15 steps \* 50 ns/step / 1000 us/ns) + 2us + (15 steps \* 50 ns/step / 1000 us/ns) = 3.5 us (round up to 4 us)

### 2.5.2.1.11.3 \_PPC (Performance Present Capabilities)

The \_PPC object is optional. Refer to the ACPI specification for details on use and content.

#### 2.5.2.1.11.4 **\_PSD (P-state Dependency)**

For [SingleLink](#) processors, the `_PSD` object is required to be generated for each core as follows:

- NumberOfEntries = 5.
- Revision = 0.
- Domain = 0.
- CoordType = FCh. (SW\_ALL)
- NumProcessors = `CPUID Fn8000_0008_ECX[NC] + 1`.

For [MultiLink](#) processors, if (`DualCoreEnabled==0`), then the `_PSD` object does not need to be generated. If (`DualCoreEnabled==1`) then the `_PSD` object must be generated for each core as follows:

- NumberOfEntries = 5.
- Revision = 0.
- Domain = `CPUID Fn0000_0001_EBX[LocalApicId[7:1]]`.
- CoordType = FEh. (HW\_ALL)
- NumProcessors = 2.

For [SingleLink](#) processors, BIOS should provide an option to choose between either `_PSD` definition.

#### 2.5.2.1.12 **XPSS (Microsoft® Extended PSS) Object**

Some Microsoft® operating systems require an XPSS object to make P-state changes function properly. A BIOS that implements an XPSS object has special requirements for the `_PCT` object. See the Microsoft *Extended PSS ACPI Method Specification* for the detailed requirements to implement these objects.

#### 2.5.2.2 **NB P-states**

The processor supports up to 2 NB P-states (NB P0 through NB P1), specified in [D18F5x1\[6C:60\]](#). Out of cold reset, the voltage and frequency of the NB is specified by [D18F5x174\[StartupNbPstate\]](#).

Support for dynamic NB P-state changes is indicated by [MSRC001\\_0071\[NbPstateDis\]](#) and more than one enabled selection in [D18F5x1\[6C:60\]\[NbPstateEn\]](#). NB P-state transitions are only supported as part of [2.5.2.3.1 \[Mixed Northbridge Frequency Configuration Sequence\]](#). The FID, DID, and VID for each NB P-state is specified in [D18F5x1\[6C:60\]\[NbFid, NbDid, NbVid\]](#). The COF for NB P-states is a function of the CLKIN frequency (nominally 200MHZ) and [D18F5x1\[6C:60\]\[NbFid, NbDid\]](#).

The two NB P-states are indexed by [D18F5x170\[NbPstateLo, NbPstateHi\]](#) and represent a low and high performance NB P-state. Transitions between [D18F5x170\[NbPstateLo, NbPstateHi\]](#) are dependent on [MSRC001\\_00\[6B:64\]\[NbPstate\]](#) and [D18F5x170\[NbPstateThreshold\]](#). NB P-states can be disabled by [D18F5x170\[SwNbPstateLoDis, NbPstateDisOnP0\]](#).

##### 2.5.2.2.1 **NB P-state Control**

The NB P-state is controlled by hardware and is not exposed to dynamic software control through ACPI objects. NB P-state control is specified by [MSRC001\\_00\[6B:64\]\[NbPstate\]](#).

The Northbridge is placed in [D18F5x170\[NbPstateHi\]](#) if any of the following are true:

- [MSRC001\\_0071\[NbPstateDis\]](#)=1
- [D18F5x170\[SwNbPstateLoDis\]](#)=1

- [D18F5x170](#)[NbPstateDisOnP0]=1 and at least one core on the node is in P0
- The number of compute units in a P-state which specifies [MSRC001\\_00\[6B:64\]](#)[NbPstate]=1 < [D18F5x170](#)[NbPstateThreshold]

The Northbridge is placed in [D18F5x170](#)[NbPstateLo] if all of the following are true:

- [MSRC001\\_0071](#)[NbPstateDis]=0
- [D18F5x170](#)[SwNbPstateLoDis]=0
- [D18F5x170](#)[NbPstateDisOnP0]=1 and there are no cores on the node in P0, or [D18F5x170](#)[NbPstateDisOnP0]=0
- The number of compute units in a P-state which specifies [MSRC001\\_00\[6B:64\]](#)[NbPstate]=1 >= [D18F5x170](#)[NbPstateThreshold]

Changes in the core P-state or [D18F5x170](#)[SwNbPstateLoDis, NbPstateDisOnP0, NbPstateThreshold] will cause the NB P-state to be re-evaluated. The current NB P-state is specified by [D18F5x174](#)[CurNbFid, CurNbDid, CurNbVid].

### 2.5.2.3 Mixed Frequency and Power P-state Configuration

Processors with different [CoreCOF](#), [NBCOF](#), and power can be mixed in a system. All NBs must have the same number of P-states. All cores must have the same number of software P-states and all equivalent software P-states must have identical ACPI CoreFreq and Power settings. See [2.5.2.1.2.1 \[Software P-state Numbering\]](#) and [2.5.2.1.11.2 \[PSS \(Performance Supported States\)\]](#).

- If [MSRC001\\_00\[6B:64\]](#)[PstateEn, CpuFid, CpuDid, IddDiv, and IddValue] are identical for all software P-states on all processors, then no BIOS modifications to [MSRC001\\_00\[6B:64\]](#) are necessary.
- If [MSRC001\\_00\[6B:64\]](#)[PstateEn, CpuFid, or CpuDid] for any software P-state differs between processors, sections [2.5.2.3.3 \[Mixed Frequency and Power P-State Configuration Rules\]](#) and [2.5.2.3.4 \[Mixed Frequency and Power P-State Configuration Sequence\]](#) are used to determine the common set of P-states and define the required BIOS modifications to [MSRC001\\_00\[6B:64\]](#).
- If [MSRC001\\_00\[6B:64\]](#)[IddDiv or IddValue] for any software P-state differs between processors and [MSRC001\\_00\[6B:64\]](#)[PstateEn, CpuFid, and CpuDid] for all software P-states do not differ between processors, then [2.5.2.3.2 \[Mixed Power P-State Configuration Sequence\]](#) defines the required BIOS modifications to [MSRC001\\_00\[6B:64\]](#).
- If [D18F5x1\[6C:60\]](#)[NbFid, NbDid, NbPstateEn] are identical for all NB P-states on all processors, then no BIOS modifications to [D18F5x1\[6C:60\]](#) are necessary. Otherwise, [2.5.2.3.1 \[Mixed Northbridge Frequency Configuration Sequence\]](#) specifies the required BIOS modifications to [D18F5x1\[6C:60\]](#).
- For all 16-bit coherent links that use 4-bit time operations, if the Northbridge and link frequencies do not meet the requirements in [2.12.4 \[Link Bandwidth Requirements\]](#), BIOS must modify the link frequencies such that the requirements are met. This should be performed after [2.5.2.3.1 \[Mixed Northbridge Frequency Configuration Sequence\]](#).

#### 2.5.2.3.1 Mixed Northbridge Frequency Configuration Sequence

BIOS must match [D18F5x1\[6C:60\]](#)[NbFid, NbDid, NbPstateEn] between all processors in the coherent fabric of a multi-socket system. The lowest setting from all processors in a multi-socket system (determined by using the following equations on each processor and selecting the lowest value) is used as the common [D18F5x1\[6C:60\]](#)[NbFid, NbDid]. Only processors with the same number of enabled NB P-states (same [D18F5x170](#)[NbPstateMaxVal]) can be mixed in a system.

For each node in the system {  
 For (i=0; i <= [D18F5x170](#)[NbPstateMaxVal]; i++) {

```

    NewNbFreq = the lowest NBCOF from all processors for NB P-state i
    NewNbFid = D18F5x1\[6C:60\]\[NbFid\] that corresponds to NewNbFreq
    NewNbDid = D18F5x1\[6C:60\]\[NbDid\] that corresponds to NewNbFreq
    Write NewNbFid and NewNbDid to D18F5x1\[6C:60\]\[NbFid, NbDid\] indexed by NB P-state i
  }
IF (D18F5x170\[NbPstateMaxVal\] == 0) THEN{
  Save D18F5x170 and D18F5x1\[6C:60\] indexed by NB P-state 1
  Copy D18F5x1\[6C:60\] indexed by NB P-state 0 to D18F5x1\[6C:60\] indexed by NB P-state 1
  Write 1 to D18F5x170\[NbPstateMaxVal, NbPstateLo\]
  Write 0 to D18F5x170\[SwNbPstateLoDis, NbPstateDisOnP0, NbPstateThreshold\]
  Wait for D18F5x174\[CurNbPstate\] = D18F5x170\[NbPstateLo\] and D18F5x174\[CurNbFid, CurNb-
Did\]=\[NbFid, NbDid\] from D18F5x1\[6C:60\] indexed by D18F5x170\[NbPstateLo\]
  Restore D18F5x170 and D18F5x1\[6C:60\] indexed by NB P-state 1
  Wait for D18F5x174\[CurNbPstate\] = D18F5x170\[NbPstateHi\]
}
}

```

The new NB frequencies are used in all subsequent NB P-state transitions. See [2.5.2.1.8 \[BIOS Requirements for Core P-state Initialization and Transitions\]](#).

### 2.5.2.3.2 Mixed Power P-State Configuration Sequence

BIOS must match [MSRC001\\_00\[6B:64\]\[IddDiv and IddValue\]](#) for each software P-state across all processors using the following sequence. For each [MSRC001\\_00\[6B:64\]](#) with [PstateEn=1](#):

1. Read [IddDiv](#) and [IddValue](#) for all processors.
2. Calculate the resulting power for each processor using the formula documented in [2.5.2.1.11.2 \[\\_PSS \(Performance Supported States\)\]](#).
3. Identify the highest power for all processors.
4. Program [IddDiv](#) and [IddValue](#) for all processors to the values from the processor with the highest calculated power.

### 2.5.2.3.3 Mixed Frequency and Power P-State Configuration Rules

- Processors with only one enabled software P-state ([D18F3xDC\[HwPstateMaxVal\]=D18F4x15C\[NumBoostStates\]](#)) cannot be mixed in a system with processors with more than one enabled software P-state ([D18F3xDC\[HwPstateMaxVal\]!=D18F4x15C\[NumBoostStates\]](#)).
- Processors with [D18F3xE8\[HtcCapable\]=1](#) cannot be mixed in a system with processors with [D18F3xE8\[HtcCapable\]=0](#).
- In a system where one or more cores are forced down to one software P-state due to board power limitations (see [2.5.2.1.9 \[Processor-Systemboard Power Delivery Compatibility Check\]](#)), all other cores in the system must be placed into the P-state specified by [D18F3x64\[HtcPstateLimit\]](#). The transition to the HTC P-state can be done at any time during the BIOS POST routine. HTC P-states must be matched according to the guidelines specified in [2.5.2.3.4 \[Mixed Frequency and Power P-State Configuration Sequence\]](#). The HTC P-state limit should be used regardless of the [D18F3xE8\[HtcCapable\]](#) value. The remaining requirements in this section can be skipped.
- The maximum performance software P0 [CoreCOF](#) for the system is equivalent to the lowest software P0 [CoreCOF](#) for any processor in the system.
- The number of software P-states for the system is equivalent to, or lower than, the lowest number of software P-states for any processor in the system.
- All [CoreCOF](#) calculations are rounded to the nearest 100 MHz frequency for the purposes of frequency

matching.

- The **CoreCOF** for any enabled software P-state can be lowered by modifying **MSRC001\_00[6B:64][CpuFid]** from the cold reset value.
- The power for any enabled P-state can be modified by writing to **MSRC001\_00[6B:64][IddDiv, IddValue]**.
- P-states can be invalidated by setting **MSRC001\_00[6B:64][PstateEn]=0**.
- P-states that are disabled at cold reset should not be enabled.
- **MSRC001\_00[6B:64][CpuVid, NbPstate]** cold reset values are not modified by the mixed frequency P-state configuration sequence for any P-state.
- No P-state changes are allowed until all appropriate steps in the sequence have been completed.

#### 2.5.2.3.4 Mixed Frequency and Power P-State Configuration Sequence

All steps in the following sequence use software P-state numbering. See [2.5.2.1.2.1 \[Software P-state Numbering\]](#).

1. Verify the rules in section [2.5.2.3.3 \[Mixed Frequency and Power P-State Configuration Rules\]](#) for all processors.
2. Match P0 CPU COF for all cores to the lowest P0 CPU COF value in the coherent fabric, and match P0 power for all cores to the highest P0 power value in the coherent fabric.
  - If all processors have only 1 enabled P-state, the following sequence should be performed on all cores:
    - Write the appropriate CpuFid and CpuDid values resulting from the matched CPU COF to **MSRC001\_00[6B:64][CpuFid, CpuDid]** indexed by **D18F3xDC[HwPstateMaxVal]**.
    - Copy **MSRC001\_00[6B:64]** indexed by **D18F3xDC[HwPstateMaxVal]** to **MSRC001\_00[6B:64]** indexed by **D18F3xDC[HwPstateMaxVal] + 1**.
    - Increment **D18F3xDC[HwPstateMaxVal]** by 1.
    - Write 001b to **MSRC001\_0062[PstateCmd]**.
    - Wait for **MSRC001\_0071[CurCpuFid, CurCpuDid] = MSRC001\_00[6B:64][CpuFid, CpuDid]** indexed by **D18F3xDC[HwPstateMaxVal]**.
    - Write 000b to **MSRC001\_0062[PstateCmd]**.
    - Wait for **MSRC001\_0071[CurPstate] = MSRC001\_0071[CurPstateLimit]**.
    - Decrement **D18F3xDC[HwPstateMaxVal]** by 1 and exit the sequence (no further steps are required).

**Table 14: Representative mixed frequency P-state table example (step 2)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Step 2                  |                                |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|--------------------------------|------------------------------|------------------------------|
|         | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  | Processor 0                  | Processor 1                    | Processor 2                  | Processor 3                  |
| P0      | 2.5 GHz<br>90 W              | 2.7 GHz<br>90 W              | 3.2 GHz<br>100 W             | 2.5 GHz<br>70 W              | 2.5 GHz<br><b>100 W</b>      | <b>2.5 GHz</b><br><b>100 W</b> | <b>2.5 GHz</b><br>100 W      | 2.5 GHz<br><b>100 W</b>      |

Refer to [Table 19](#) for notes.

3. Match the CPU COF and power for P-states used by HTC:

- Skip to step 4 if any processor reports **D18F3xE8**[HTC Capable]=0.
- Identify the lowest CPU COF for all processors in the P-state pointed to by **D18F3x64**[HtcPstateLimit].
- Modify the CPU COF pointed to by **D18F3x64**[HtcPstateLimit] to the previously identified lowest CPU COF value.
- Identify the highest power for all processors in the P-state pointed to by **D18F3x64**[HtcPstateLimit].
- Modify the power pointed to by **D18F3x64**[HtcPstateLimit] to the previously identified highest power value.

**Table 15: Representative mixed frequency P-state table example (step 3)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Step 3                  |                              |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
|         | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  |
| P0      | 2.5 GHz<br>90 W              | 2.7 GHz<br>90 W              | 3.2 GHz<br>100 W             | 2.5 GHz<br>70 W              | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             |
| P1      | 2.2 GHz <sup>1</sup><br>80 W | 2.4 GHz<br>80 W              | 3.0 GHz <sup>1</sup><br>90 W | 2.3 GHz <sup>1</sup><br>60 W | 2.2 GHz <sup>1</sup><br>90 W | 2.4 GHz<br>80 W              | 2.2 GHz <sup>1</sup><br>90 W | 2.2 GHz <sup>1</sup><br>90 W |
| P2      | 1.8 GHz<br>70 W              | 2.2 GHz <sup>1</sup><br>70 W | 2.4 GHz<br>80 W              | 1.8 GHz<br>50 W              | 1.8 GHz<br>70 W              | 2.2 GHz <sup>1</sup><br>90 W | 2.4 GHz<br>80 W              | 1.8 GHz<br>50 W              |
| P3      | 1.2 GHz<br>60 W              | 1.0 GHz<br>60 W              | 1.6 GHz<br>70 W              | 500 MHz <sup>2</sup><br>40 W | 1.2 GHz<br>60 W              | 1.0 GHz<br>60 W              | 1.6 GHz<br>70 W              | 500 MHz <sup>2</sup><br>40 W |
| P4      | 500 MHz <sup>2</sup><br>50 W | 600 MHz <sup>2</sup><br>50 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             | 500 MHz <sup>2</sup><br>50 W | 600 MHz <sup>2</sup><br>50 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             |

Refer to [Table 19](#) for notes.

- Match the CPU COF and power for the lowest performance P-state:
  - If (**D18F3xDC**[HwPstateMaxVal]==**D18F3x64**[HtcPstateLimit]) for any processor, then set PstateEn=0 for all P-states greater than the P-state pointed to by **D18F3x64**[HtcPstateLimit] for all processors, skip the remaining actions in this step, and go to step 5.
  - Identify the lowest CPU COF for all processors in the P-state pointed to by **D18F3xDC**[HwPstateMaxVal].
  - Modify the CPU COF for all processors in the P-state pointed to by **D18F3xDC**[HwPstateMaxVal] to the previously identified lowest CPU COF value.
  - Identify the highest power for all processors in the P-state pointed to by **D18F3xDC**[HwPstateMaxVal].
  - Modify the power for all processors in the P-state pointed to by **D18F3xDC**[HwPstateMaxVal] to the previously identified highest power value.

**Table 16: Representative mixed frequency P-state table example (step 4)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Step 4                  |                              |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
|         | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  |
| P0      | 2.5 GHz<br>90 W              | 2.7 GHz<br>90 W              | 3.2 GHz<br>100 W             | 2.5 GHz<br>70 W              | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             |
| P1      | 2.2 GHz <sup>1</sup><br>80 W | 2.4 GHz<br>80 W              | 3.0 GHz <sup>1</sup><br>90 W | 2.3 GHz <sup>1</sup><br>60 W | 2.2 GHz <sup>1</sup><br>90 W | 2.4 GHz<br>80 W              | 2.2 GHz <sup>1</sup><br>90 W | 2.2 GHz <sup>1</sup><br>90 W |

Refer to Table 19 for notes.

5. Modify **D18F3xDC**[HwPstateMaxVal] to indicate the lowest performance P-state with PstateEn set for each processor (step 4 can disable P-states pointed to by **D18F3xDC**[HwPstateMaxVal]).
6. Match the CPU COF and power for upper intermediate P-states:
  - Upper intermediate P-states = P-states between (not including) P0 and **D18F3x64**[HtcPstateLimit].
  - Define each of the available upper intermediate P-states; for each processor concurrently evaluate the following loop; when any processor falls out of the loop (runs out of available upper intermediate P-states) all other processors have their remaining upper intermediate P-states invalidated (PstateEn=0); for (i = **D18F3x64**[HtcPstateLimit]-1; i > **D18F4x15C**[NumBoostStates]; i--)
    - Identify the lowest CPU COF for P(i).
    - Identify the highest power for P(i).
    - Modify P(i) CPU COF for all processors to the previously identified lowest CPU COF value.
    - Modify P(i) power for all processors to the previously identified highest power value.

**Table 17: Representative mixed frequency P-state table example (step 6)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Step 6                  |                              |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
|         | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  |
| P0      | 2.5 GHz<br>90 W              | 2.7 GHz<br>90 W              | 3.2 GHz<br>100 W             | 2.5 GHz<br>70 W              | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             |

| P2      | 1.8 GHz<br>70 W              | 2.2 GHz <sup>1</sup><br>70 W | 2.4 GHz<br>80 W              | 1.8 GHz<br>50 W              | 1.8 GHz<br>70 W              | 2.2 GHz <sup>1</sup><br>90 W | 2.4 GHz<br>80 W              | 1.8 GHz<br>50 W              |
| P3      | 1.2 GHz<br>60 W              | 1.0 GHz<br>60 W              | 1.6 GHz<br>70 W              | 500 MHz <sup>2</sup><br>40 W | 1.2 GHz<br>60 W              | 1.0 GHz<br>60 W              | 1.6 GHz<br>70 W              | 500 MHz <sup>2</sup><br>60 W |
| P4      | 500 MHz <sup>2</sup><br>50 W | 600 MHz <sup>2</sup><br>50 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             | 500 MHz <sup>2</sup><br>60 W | 500 MHz <sup>2</sup><br>60 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             |

Refer to Table 19 for notes.

Example description:

**D18F3x64**[HtcPstateLimit] = **D18F4x15C**[NumBoostStates] + 1 for processors 0, 2, and 3. Therefore, proces-

sor 1 must have P1 invalidated (remaining upper intermediate P-state). Execution skips to the next numbered step.

7. Match the CPU COF and power for lower intermediate P-states:

- Lower intermediate P-states = P-states between (not including) [D18F3x64\[HtcPstateLimit\]](#) and [D18F3xDC\[HwPstateMaxVal\]](#)
- If [D18F3xDC\[HwPstateMaxVal\]](#) - [D18F3x64\[HtcPstateLimit\]](#) < 2 for any processor, set PstateEn=0 for enabled lower intermediate P-states for all processors with [D18F3xDC\[HwPstateMaxVal\]](#) - [D18F3x64\[HtcPstateLimit\]](#) > 1 and skip the remaining actions for this numbered step.
- Define each of the available lower intermediate P-states; for each processor concurrently evaluate the following loop; when any processor falls out of the loop (runs out of available lower intermediate P-states) all other processors have their remaining lower intermediate P-states invalidated (PstateEn=0); for (i = [D18F3xDC\[HwPstateMaxVal\]](#)-1; i > [D18F3x64\[HtcPstateLimit\]](#); i--)
  - Identify the lowest CPU COF for P(i).
  - Identify the highest power P(i).
  - Modify P(i) CPU COF for all processors to the previously identified lowest CPU COF value.
  - Modify P(i) power for all processors to the previously identified highest power value.

**Table 18: Representative mixed frequency P-state table example (step 7)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Step 7                  |                              |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
|         | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  | Processor 0                  | Processor 1                  | Processor 2                  | Processor 3                  |
| P0      | 2.5 GHz<br>90 W              | 2.7 GHz<br>90 W              | 3.2 GHz<br>100 W             | 2.5 GHz<br>70 W              | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             | 2.5 GHz<br>100 W             |
| P1      | 2.2 GHz <sup>1</sup><br>80 W | 2.4 GHz<br>80 W              | 3.0 GHz <sup>1</sup><br>90 W | 2.3 GHz <sup>1</sup><br>60 W | 2.2 GHz <sup>1</sup><br>90 W | N/A <sup>3</sup>             | 2.2 GHz <sup>1</sup><br>90 W | 2.2 GHz <sup>1</sup><br>90 W |
| P2      | 1.8 GHz<br>70 W              | 2.2 GHz <sup>1</sup><br>70 W | 2.4 GHz<br>80 W              | 1.8 GHz<br>50 W              | N/A <sup>3</sup>             | 2.2 GHz <sup>1</sup><br>90 W | N/A <sup>3</sup>             | 1.0 GHz<br>70 W              |
| P3      | 1.2 GHz<br>60 W              | 1.0 GHz<br>60 W              | 1.6 GHz<br>70 W              | 500 MHz <sup>2</sup><br>40 W | 1.0 GHz<br>70 W              | 1.0 GHz<br>70 W              | 1.0 GHz<br>70 W              | 500 MHz <sup>2</sup><br>60 W |
| P4      | 500 MHz <sup>2</sup><br>50 W | 600 MHz <sup>2</sup><br>50 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             | 500 MHz <sup>2</sup><br>60 W | 500 MHz <sup>2</sup><br>60 W | 500 MHz <sup>2</sup><br>60 W | N/A <sup>3</sup>             |

Refer to [Table 19](#) for notes.

Example description:

[D18F3xDC\[HwPstateMaxVal\]](#) - [D18F3x64\[HtcPstateLimit\]](#) > 1 for all processors. Therefore, the conditions of the first bullet are not met and execution continues to bullet two.

Loop index i initializes to:

P3 for processors 0, 1, and 2

P2 for processor 3

On the first iteration of the loop processor 1 has the lowest CPU COF of 1.0 GHz for P(i), and processor 2 has the highest power of 70 W for P(i). The P(i) values of each processor are modified to 1.0 GHz and 70 W.

The loop index i is decremented for all processors.

Processor 1 fails the loop index test of i > [D18F3x64\[HtcPstateLimit\]](#) with i = 2 and [D18F3x64\[HtcPstateLimit\]](#) = 2. Processor 3 fails the loop index test of i > [D18F3x64\[HtcPstateLimit\]](#) with i = 1 and [D18F3x64\[HtcPstateLimit\]](#) = 1.

P2 is invalidated for processors 0 and 2 (remaining lower intermediate P-state).

Execution skips to the next numbered step.

8. Place all cores into a valid COF and VID configuration corresponding to an enabled P-state:
- Select an enabled P-state not equal to the P-state pointed to by [MSRC001\\_0063](#)[CurPstate] for each core.
  - Transition all cores to the selected P-states by writing the Control value from the `_PSS` object corresponding to the selected P-state to [MSRC001\\_0062](#)[PstateCmd].
  - Wait for all cores to report the Status value from the `_PSS` object corresponding to the selected P-state in [MSRC001\\_0063](#)[CurPstate].

**Table 19: Representative mixed frequency P-state table example (final)**

| P-state | Cold Reset                   |                              |                              |                              | Post-Algorithm               |                              |                              |                              |
|---------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|

Notes:

- \* Indicates the P-state pointed to by [D18F3x64\[HtcPstateLimit\]](#) at cold reset.
- Refer to [2.5.2.1.11.2 \[\\_PSS \(Performance Supported States\)\]](#) for details on \_PSS object creation and field definitions for CoreFreq, Power, Control, and Status.
- TransitionLatency and BusMasterLatency are not modified by the mixed frequency P-state algorithm and are not shown.
- Units are not indicative of the conventions required by the ACPI \_PSS object. Refer to [2.5.2.1.11.2 \[\\_PSS \(Performance Supported States\)\]](#) for details on \_PSS object creation.

### 2.5.3 C-states

C-states are processor power states. C0 is the operational state in which instructions are executed. All other C-states are low-power states in which instructions are not executed. When coming out of warm and cold reset, the processor is transitioned to the C0 state.

#### 2.5.3.1 C-state Names and Numbers

C-states are often referred to by an alphanumeric naming convention, C1, C2, C3, etc. The mapping between ACPI defined C-states and AMD specified C-states is not direct. AMD specified C-states are referred to as per-core IO-based C-states. Up to three per-core IO-based C-states are supported, per-core IO-based C-state 0, 1, and 2. The per-core IO-based C-state index corresponds to the offset added to [MSRC001\\_0073\[CstateAddr\]](#) to initiate a C-state request. See [2.5.3.2 \[C-state Request Interface\]](#). The actions taken by the processor when entering a low-power C-state are configured by software. See [2.5.3.3 \[C-state Actions\]](#) for information about AMD specific actions.

#### 2.5.3.2 C-state Request Interface

C-states are dynamically requested by software and are exposed through ACPI objects (see [2.5.3.6 \[ACPI Processor C-state Objects\]](#)). C-states can be requested on a per-core basis. Software requests a C-state change in one of two ways, either by executing the HLT instruction or by reading from an IO address specified by [MSRC001\\_0073\[CstateAddr\]](#) plus an offset of 0 through 7 (see [D18F4x11\[C:8\]](#)). The processor always returns 0 for this IO read. Offsets 2 through 7 result in an offset of 2. Executing the HLT instruction is equivalent to reading from the IO address specified by [D18F4x128\[HaltCstateIndex\]](#). When software requests a C-state transition, hardware evaluates any frequency and voltage domain dependencies and determines which C-state actions to execute. See [2.5.4 \[Frequency and Voltage Domain Dependencies\]](#) and [2.5.3.3 \[C-state Actions\]](#).

#### 2.5.3.3 C-state Actions

A core takes one of several different possible actions based upon a C-state change request from software. Regardless of the method used to enter a C-state (see [2.5.3.2 \[C-state Request Interface\]](#)), [D18F4x128\[CoreCstateMode\]](#) indicates whether the C-state actions are specified by the C1 SMAF code or the C-state action field that corresponds to the IO address read by software. The C1 SMAF code is defined in [F3x84\[31:24\]](#) and the C-state action fields are defined in [D18F4x11\[C:8\]](#).

##### 2.5.3.3.1 C-state Divisors and Probes

When a core enters a non-C0 state, its clock is ramped down to a divisor specified by [D18F3x\[84:80\]\[ClkDivisor\]](#) or [D18F4x11\[C:8\]\[ClkDivisor\]](#). If probes occur during this time and the caches are not flushed by hardware, the core clock may be ramped back up to the C0 frequency to service the probes, as specified by [D18F3x\[84:80\]\[CpuPrbEn\]](#) or [D18F4x11\[C:8\]\[CpuPrbEn\]](#). See [2.5.3.3.2 \[C-state Cache Flush\]](#).

### 2.5.3.3.2 C-state Cache Flush

A core can flush its L1 and L2 caches after it enters any non-C0 state. Once a core flushes its caches, probes are no longer sent to that core. This improves probing performance for cores that are in C0.

If a core enters a non-C0 state and cache flush is enabled a timer counts down for a programmable period of time.

- Cache flush is enabled if  $((D18F4x128[CoreCstateMode]==1) ? (D18F3xDC[CacheFlushOnHaltCtl]!=0) : (D18F4x11[C:8][CacheFlushEn]==1))$
- The programmable period of time is specified by  $D18F3xDC[CacheFlushOnHaltTmr]$  if  $(D18F4x128[CoreCstateMode]==1)$  or  $D18F4x11[C:8][CacheFlushTmrSel]$  if  $(D18F4x128[CoreCstateMode]==0)$ .
- Each compute unit has one timer that is shared by both cores.

When the timer expires, the core flushes its L1 and L2 caches to either the L3 (if the processor supports an L3) or to DRAM (if the processor does not support an L3). During the cache flush, clocks are ramped down as specified by  $D18F3x84:80[ClkDivisor]$  if  $(D18F4x128[CoreCstateMode]==0)$  or by  $D18F4x11[C:8][ClkDivisor]$  if  $(D18F4x128[CoreCstateMode]==1)$ . After the cache flush is complete, clocks are ramped down as specified by  $D18F3xDC[CacheFlushOnHaltCtl]$ .

The timer is reset if the core exits the C-state for any reason. A cache flush success monitor tracks the success rate of cache flush timer expirations relative to the core exiting a C-state. Based on the success rate, caches may be flushed immediately without waiting for the cache flush timer to expire. See  $D18F4x128[CacheFlushSucMonThreshold]$ . When the core resumes normal execution, the caches refill as normal.

### 2.5.3.3.3 Core C6 (CC6) State

A core can gate off power to its internal logic when it enters any non-C0 state. This power gated state is known as CC6. Power gating reduces the amount of dynamic power consumed by the core. VDD is not reduced when a core is in CC6. The following actions are taken by hardware prior to CC6 entry:

1. If  $MSRC001_0071[CurPstate] < D18F3xA8[PopDownPstate]$ , transition the core P-state to  $D18F3xA8[PopDownPstate]$ .
2. L1 and L2 caches are flushed to DRAM. See 2.5.3.3.2 [C-state Cache Flush].
3. Internal core state is saved to DRAM.
4. Power is removed from the core.

All of the following must be true in order for a core to be placed into CC6:

1.  $D18F4x11[C:8][CacheFlushEn]=1$  for the corresponding C-state action field.
2.  $D18F4x11[C:8][CacheFlushTmrSel] \neq 11b$  for the corresponding C-state action field.
3.  $D18F4x11[C:8][PwrGateEn]=1$  for the corresponding C-state action field.
4.  $D18F2x118[CC6SaveEn]=1$ .
5.  $D18F2x118[LockDramCfg]=1$ .
6.  $D18F4x128[CoreCstateMode]=0$ .
7. The CC6 storage area in DRAM is configured. See 2.10.8 [DRAM CC6 Storage].

The time required to enter and exit CC6 is directly proportional to the core P-state frequency. Slower core frequencies require longer entry and exit times. Latency issues may occur with core P-state frequencies less than 800MHz.

#### 2.5.3.4 Exiting C-states

The following events may cause the processor to exit from a HLT initiated C-state:

- INTR
- NMI
- SMI
- INIT
- STARTUP

The following events always cause the processor to exit from a HLT initiated C-state:

- STPCLK assertion messages.
- RESET\_L assertion.

The following events always cause the processor to exit from an IO read initiated C-state:

- INTR
- NMI
- SMI
- INIT
- STARTUP
- STPCLK assertion messages
- RESET\_L assertion

The following events never cause the processor to exit from a HLT or IO read initiated C-state:

- A20M
- IGNNE
- machine check error

If an INTR is received while a core is in a non-C0 C-state, the state of EFLAGS[IF] and the mechanism used to enter the non-C0 C-state determine the actions taken by the processor.

- Entry via HLT, EFLAGS[IF]==0: The interrupt does not wake up the core.
- Entry via HLT, EFLAGS[IF]==1: The interrupt wakes the core and the core begins execution at the interrupt service routine.
- Entry via IO read, EFLAGS[IF]==0: The interrupt wakes the core and the core begins execution at the instruction after the IN instruction that was used to enter the non-C0 C-state.
- Entry via IO read, EFLAGS[IF]==1: The interrupt wakes the core and the core begins execution at the interrupt service routine.

#### 2.5.3.5 C1 Enhanced State (C1E)

The C1 enhanced state (C1E) is a stop-grant state supported by the processor. The C1E state is characterized by the following properties:

- All cores are in a non-C0 state.
- The ACPI-defined P\_LVL3 register has been accessed.
- The chipset has issued a STPCLK assertion message with the appropriate SMAF for C1E entry. Note that [D18F3x\[84:80\]](#) specify the processor clocking and voltage behavior in response to the C1E SMAF.
- The processor has issued a STOP\_GRANT message to the chipset.

General requirements for C1E:

- The ACPI-defined C2 and C3 states that require IO hub support must not be declared to the operating system.
- C1E should only be enabled when the platform is in ACPI power management mode.

### 2.5.3.5.1 Message Triggered C1E

Message triggered C1E is built upon dedicated hardware, a set of specific messages, board-level sideband signals, and timers in the IO hub.

The following board-level link-defined sideband signals are used in this protocol:

- **ALLOW\_LDTSTOP**: Board-level wired-OR signal. ALLOW\_LDTSTOP is driven by all chipset NBs in the system and is an input to the IO hub. When ALLOW\_LDTSTOP is asserted, the IO hub is permitted to assert LDTSTOP\_L. When ALLOW\_LDTSTOP is deasserted the IO hub must deassert LDTSTOP\_L, and keep it deasserted until ALLOW\_LDTSTOP asserts, after which a programmable period of time must pass before LDTSTOP\_L can be asserted. The IO hub must be configured to treat a deassertion of ALLOW\_LDTSTOP as also being an assertion of BMREQ#. BMREQ# is the bus-mastering request input of the IO hub, and is a distinct input from ALLOW\_LDTSTOP.
- **IDLE\_EXIT\_L**: Board-level wired-OR signal. IDLE\_EXIT\_L is driven by all processors in the system and is an input to the IO hub. IDLE\_EXIT\_L is asserted by the processor when it receives a Fixed or ExtInt interrupt while the target core is in STOP\_GRANT. When IDLE\_EXIT\_L is asserted, the IO hub initiates the C1E exit sequence. IDLE\_EXIT\_L is deasserted by the processor when the target core exits STOP\_GRANT. See also [D18F3xA0](#)[IdleExitEn].

### 2.5.3.5.2 BIOS Requirements to Initialize Message Triggered C1E

To enable and configure message triggered C1E, software must program the following registers on all nodes in the system:

- [D18F3xD4](#)[MTC1eEn]=1.
- [MSRC001\\_0055](#)[BmStsClrOnHaltEn]=1; [MSRC001\\_0055](#)[IOMsgAddr]=”the base address of the BM\_STS register in the IO hub”.
- See [D18F3xD4](#)[CacheFlushImmOnAllHalt].
- See [D18F3xDC](#)[CacheFlushOnHaltCtl].
- See [D18F4x11](#)[C:8][CacheFlushEnCstAct0, CacheFlushEnCstAct1].
- See [D18F3xD4](#)[StutterScrubEn].
- [MSRC001\\_0015](#)[HltXSpCycEn]= 1.
- [D18F3xA0](#)[IdleExitEn] = 1.
- [D18F4x128](#)[CstateMsgDis] = 0.

### 2.5.3.6 ACPI Processor C-state Objects

Processor power control is implemented through the \_CST object in ACPI 2.0 and later revisions. The presence of the \_CST object indicates to the OS that the platform and processor are capable of supporting multiple power states. BIOS must provide the \_CST object and define other ACPI parameters to support operating systems that provide native support for processor C-state transitions. See [2.5.3.6.1 \[\\_CST\]](#) and [2.5.3.6.2 \[\\_CSD\]](#).

The \_CST object is not supported with ACPI 1.0b. BIOS should provide FADT entries to support operating systems that are not compatible with ACPI 2.0 and later revisions. See [2.5.3.6.4 \[Fixed ACPI Description Table \(FADT\) Entries\]](#).

#### 2.5.3.6.1 \_CST

The \_CST object should be generated for each core as follows:

- Count = 1.
- Register = [MSRC001\\_0073](#)[CstateAddr] + 1.
- Type = 2.

- Latency = 100.
- Power = 0.

#### 2.5.3.6.2 **\_CSD**

If ([DualCoreEnabled](#)==1) then the `_CSD` object should be generated for each core as follows:

- NumberOfEntries = 6.
- Revision = 0.
- Domain = [CPUID Fn0000\\_0001\\_EBX](#)[LocalApicId[7:1]].
- CoordType = FEh. (HW\_ALL)
- NumProcessors = 2.
- Index = 0.

If ([DualCoreEnabled](#)==0) then the `_CSD` object should not be generated.

#### 2.5.3.6.3 **\_CRS**

BIOS must declare in the root host bridge `_CRS` object that the IO address range from [MSRC001\\_0073](#)[CstateAddr] to [MSRC001\\_0073](#)[CstateAddr]+7 is consumed by the host bridge.

#### 2.5.3.6.4 **Fixed ACPI Description Table (FADT) Entries**

Declare the following FADT entries:

- P\_LVL2\_LAT = 100.
- P\_LVL3\_LAT = 1001.
- FLAGS.PROC\_C1 = 1.
- FLAGS.P\_LVL2\_UP = 1.

Declare the following P\_BLK entries:

- P\_LVL2 = [MSRC001\\_0073](#)[CstateAddr] + 1.

BIOS must declare the PSTATE\_CNT entry as 00h.

#### 2.5.3.7 **BIOS Requirements for Initialization**

1. Initialize [MSRC001\\_0073](#)[CstateAddr] with an available IO address. See 2.5.3.6.4 [Fixed ACPI Description Table (FADT) Entries].
2. Initialize [D18F4x11](#)[C:8].
3. Generate ACPI objects as described in 2.5.3.6 [ACPI Processor C-state Objects].

### 2.5.4 **Frequency and Voltage Domain Dependencies**

Whenever a P-state or C-state is requested on a given core, hardware must take frequency and voltage domain dependencies into account when deciding whether to make the requested state change. Cores within a compute unit share a common frequency and voltage domain, so they must always be at the same P-state and C-state. Compute units within a processor have independent frequency domains, but share a common voltage domain. The voltage is determined by the highest-performance P-state requested on any core.

#### 2.5.4.1 **Dependencies Between Cores in a Compute Unit**

When software requests different power management states for the cores in a compute unit, hardware determines which state to target as follows:

**Table 21: Dependencies Between Cores in a Compute Unit**

| Core 0 Request | Core 1 Request | Policy  | Compute Unit State   |
|----------------|----------------|---|--|
| C-state        | C-state        | Frequency is determined by <a href="#">D18F4x128[CoreCstatePolicy]</a> . Voltage is determined by <a href="#">D18F4x128[CoreCstatePolicy]</a> if there is a voltage change associated with the C-state, otherwise voltage is determined by the highest performance P-state requested on any core. | Highest performance P-state, C-state is determined by <a href="#">D18F4x128[CoreC-statePolicy]</a> |
| P-state        | P-state        | Frequency and voltage is determined by the highest performance P-state requested on any core  | Highest performance P-state, C0  |
| C-state        | P-state        | Frequency and voltage is determined by the highest performance P-state requested on any core  | Highest performance P-state, C0  |
| P-state        | C-state        | Frequency and voltage is determined by the highest performance P-state requested on any core  | Highest performance P-state, C0  |

### 2.5.5 S-states

S-states are ACPI defined sleep states. S0 is the operational state. All other S-states are low-power states in which various voltage rails in the system may or may not be powered. See the ACPI specification for descriptions of each S-state.

#### 2.5.5.1 ACPI Suspend to RAM State (S3)

The processor supports the ACPI-defined S3 state. Software is responsible for restoring the state of the processor's registers when resuming from S3. All registers in the processor that BIOS initialized during the initial boot must be restored. The method used to restore the registers is system specific.

During S3 entry, system memory enters self-refresh mode. Software is responsible for bringing memory out of self-refresh mode when resuming from S3. To bring memory out of self-refresh mode, see [2.10.5 \[DCT/DRAM Initialization and Resume\]](#).

Many of the systemboard power planes for the processor are powered down during S3. Refer to the electrical data sheet for the following ([1.2 \[Reference Documents\]](#)):

- Power plane electrical requirements during S3.
- Power plane sequencing requirements on S3 entry and exit.
- System signal states for both inputs (e.g. PWROK and RESET\_L) and outputs (e.g. VID[\*], PSI\_L bit, THERMTRIP\_L, etc.) during S3.
- System signal sequencing requirements on S3 entry and exit.
- System management message sequencing on S3 entry and exit.

### 2.5.6 Effective Frequency Interface

The effective frequency interface allows software to discern the average, or effective, frequency of a given core over a configurable window of time. This provides software a measure of actual performance rather than forcing software to assume the current frequency of the core is the frequency of the last P-state requested. This can be useful when the P-state is limited by HTC, [D18F3x68](#), SBI, or CPB.

The following procedure calculates effective frequency by periodically reading two counters, APERF ([MSR0000\\_00E8 \[Actual Performance Frequency Clock Count \(APERF\)\]](#)) and MPERF ([MSR0000\\_00E7](#)

[Max Performance Frequency Clock Count (MPERF)]).

Effective frequency is calculated as follows:

1. Read APERF and MPERF.
2. An interval greater than 1 ms.
3. Read APERF and MPERF.
4. Calculate effective frequency =  $((\text{APERF}_{\text{NEW}} - \text{APERF}_{\text{OLD}}) / \{\text{MPERF}_{\text{NEW}} - \text{MPERF}_{\text{OLD}}\}) * \text{P0 frequency}$  using software P-state numbering.

Additional notes:

- When reading or writing APERF and MPERF, software must disable interrupts or any other events that may occur in between writing APERF and writing MPERF or between reading APERF and reading MPERF.
- The behavior of APERF and MPERF may be modified by [MSRC001\\_0015](#)[EffFreqCntMwait].
- The accuracy of the effective frequency interface is +/- 50MHz if the following constraints are met:
  - Effective frequency is calculated no more frequently than once per 1 ms period.
  - Software executes only MOV instructions, and no more than 3 MOV instructions, between reading or writing APERF and MPERF.
  - The other core of the compute unit is not performing a long latency operation. For example: cache flush operations such as the WBINVD instruction, IO read operations, and switching between host and SVM guest modes.
- APERF and MPERF are invalid if an overflow occurs.

## 2.6 Processor State Transition Sequences

### 2.6.1 ACPI Power State Transitions

This section specifies ACPI power state transitions as controlled by [D18F3x\[84:80\]](#) or [D18F4x11\[C:8\]](#). All references to [D18F4x11\[C:8\]](#) in this section also apply to [D18F3x\[84:80\]](#). See [D18F4x128](#)[CoreCstateMode].

The following describes the state transition behavior associated with ACPI power state transitions:

- All C-state controllable parameters take effect after an LDTSTOP\_L assertion except ClkDivisorCstAct, which takes effect before the LDTSTOP\_L assertion.
- ClkDivisorCstAct:
  - [D18F4x11\[C:8\]](#)[ClkDivisorCstAct] is applied after the processor has transitioned from C0 to a low-power state (halt or stop-grant) and the hysteresis time ([D18F3xD4](#)[ClkRampHystSel]) has elapsed.
  - [D18F4x11\[C:8\]](#)[ClkDivisorCstAct] is removed when the processor transitions from a low-power state to C0 or when a probe occurs and [D18F4x11\[C:8\]](#)[CpuPrbEnCstAct]=0.
- Probes:
  - [D18F4x11\[C:8\]](#)[CpuPrbEnCstAct] specifies how probes are handled while in the low-power state.
- DRAM:
  - DRAM self refresh is enabled and the memory clock is tristated if LDTSTOP\_L is asserted.
  - When LDTSTOP\_L is deasserted the DRAM memory clock is enabled and self refresh is disabled.
    - Occurs in parallel to re-connecting the link.

Refer to the HyperTransport™ link specification for system management sequencing requirements when performing ACPI state transitions.

## 2.7 Performance Monitoring

The processor includes support for two methods of monitoring processor performance: performance monitor counters and instruction based sampling (IBS). There are two types of performance counters: [2.7.1 \[Core Per-](#)

formance Monitor Counters], consisting of one set located in each core of each compute unit and 2.7.2 [NB Performance Monitor Counters].

### 2.7.1 Core Performance Monitor Counters

The core performance monitor counters are used by software to count specific events that occur in a core of the compute unit. Unless otherwise specified, core performance events count only the activity of the core, not activity caused by the other core of the compute unit. Each core of each compute unit provides six 48-bit performance counters.

MSRC001\_020[A,8,6,4,2,0] [Performance Event Select (PERF\_CTL[5:0])] specify the events to be monitored and how they are monitored. MSRC001\_020[B,9,7,5,3,1] [Performance Event Counter (PERF\_CTR[5:0])] are the counters. MSRC001\_00[03:00] is the legacy alias for MSRC001\_020[6,4,2,0]. MSRC001\_00[07:04] is the legacy alias for MSRC001\_020[7,5,3,1].

All of the events are specified in 3.15 [Core Performance Counter Events].

Some performance monitor events have a maximum count per clock that exceeds one event per clock. These performance events are called multi-events. Some counters support a greater multi-event count per clock than others. Events that are multi-events will specify the maximum multi-event count per clock. E.g. The number of events logged per cycle can vary from 0 to X. An event that doesn't specify multi-event is implied to be a maximum of 1 event per clock. Undefined results will be produced if an multi-event is selected that exceeds that counters capabilities. The following list specifies the maximum number of multi-events supported by each counter:

- PERF\_CTL[0]: 31 multi-event per clock maximum.
- PERF\_CTL[1]: 7 multi-event per clock maximum.
- PERF\_CTL[2]: 7 multi-event per clock maximum.
- PERF\_CTL[3]: 63 multi-event per clock maximum.
- PERF\_CTL[4]: 7 multi-event per clock maximum.
- PERF\_CTL[5]: 7 multi-event per clock maximum.

Not all performance monitor events can be counted on all counters. The performance counter registers are generally assigned to specific blocks of the core according to Table 22; however, there are exceptions when an events is implemented by another block of the core and therefore has the counter restrictions of that block. Each core event description starts with one of the following terms to indicate which counters support that event. Selecting an event for a counter that does not support that counter will produce undefined results.

**Table 22: Core PMC mapping to PERF\_CTL[5:0]**

| Term                 | Definition   |
|----------------------|--|
| <b>PERF_CTL[5:0]</b> | PERF_CTL[5:0] are used to count events in the LS/DC and EX where the number of events logged per cycle can vary up to 7.           |
| <b>PERF_CTL[3,0]</b> | PERF_CTL[3,0] are used to count events in the LS/DC and EX where the number of events logged per cycle can vary up to 31.          |
| <b>PERF_CTL[0]</b>   | PERF_CTL[0] are used to count events in the LS/DC, EX, IF/DE and CU where the number of events logged per cycle can vary up to 31. |

**Table 22: Core PMC mapping to PERF\_CTL[5:0]**

| Term                 | Definition  |
|----------------------|---|
| <b>PERF_CTL[3]</b>   | PERF_CTL[3] are used to count events in the LS/DC, EX and FP where the number of events logged per cycle can vary up to 63. |
| <b>PERF_CTL[2:0]</b> | PERF_CTL[2:0] are used to count events in the IF/DE and CU; The number of events logged per cycle can vary up to 7.         |
| <b>PERF_CTL[5:3]</b> | PERF_CTL[5:3] are used to count events in the FP; The number of events logged per cycle can vary up to 7.                   |

Writing the performance counters can be useful if there is an intention for software to count a specific number of events, and then trigger an interrupt when that count is reached. An interrupt can be triggered when a performance counter overflows. Software should use the WRMSR instruction to load the count as a two's-complement negative number into the performance counter. This causes the counter to overflow after counting the appropriate number of times.

In addition to the RDMSR instruction, the PERF\_CTR[5:0] registers can be read using a special read performance-monitoring counter instruction, RDPMC.

The accuracy of the performance counters is not ensured. The performance counters are not assured of producing identical measurements each time they are used to measure a particular instruction sequence, and they should not be used to take measurements of very small instruction sequences. The RDPMC instruction is not serializing, and it can be executed out-of-order with respect to other instructions around it. Even when bound by serializing instructions, the system environment at the time the instruction is executed can cause events to be counted before the counter value is loaded into EDX:EAX.

### 2.7.2 NB Performance Monitor Counters

The NB performance monitor counters are used by software to count specific events that occur in the NB. Each node provides four 48-bit performance counters.

MSRC001\_024[6,4,2,0] [Northbridge Performance Event Select (NB\_PERF\_CTL[3:0])] and MSRC001\_024[7,5,3,1] [Northbridge Performance Event Counter (NB\_PERF\_CTR[3:0])] specify the events to be monitored and how they are monitored.

All of the events are specified in 3.16 [NB Performance Counter Events].

All NB performance monitor events can be counted on all counters. E.g. Unlike core performance events, there are no NB events that can not be counted on some NB performance counters.

All NB performance events are one event per clock. E.g. Unlike core performance events, there are no NB multi-event performance events.

NB performance counters do not support APIC interrupt capability.

In addition to the RDMSR instruction, the NB\_PERF\_CTR[3:0] registers can be read using a special read performance-monitoring counter instruction, RDPMC.

The accuracy of the performance counters is not ensured. The performance counters are not assured of producing identical measurements each time they are used to measure a particular instruction sequence, and they should not be used to take measurements of very small instruction sequences. The RDPMC instruction is not

serializing, and it can be executed out-of-order with respect to other instructions around it. Even when bound by serializing instructions, the system environment at the time the instruction is executed can cause events to be counted before the counter value is loaded into EDX:EAX.

### 2.7.3 Instruction Based Sampling (IBS)

IBS is a code profiling mechanism that enables the processor to select a random instruction fetch or micro-op after a programmed time interval has expired and record specific performance information about the operation. An interrupt is generated when the operation is complete as specified by [MSRC001\\_103A \[IBS Control\]](#). An interrupt handler can then read the performance information that was logged for the operation.

The IBS mechanism is split into two parts: instruction fetch performance controlled by [MSRC001\\_1030 \[IBS Fetch Control \(IC\\_IBS\\_CTL\)\]](#); and instruction execution performance controlled by [MSRC001\\_1033 \[IBS Execution Control \(SC\\_IBS\\_CTL\)\]](#). Instruction fetch sampling provides information about instruction TLB and instruction cache behavior for fetched instructions. Instruction execution sampling provides information about micro-op execution behavior. The data collected for instruction fetch performance is independent from the data collected for instruction execution performance. Support for the IBS feature is indicated by the [CPUID Fn8000\\_0001\\_ECX\[IBS\]](#).

Instruction fetch performance is profiled by recording the following performance information for the tagged instruction fetch:

- If the instruction fetch completed or was aborted. See [MSRC001\\_1030](#).
- The number of clock cycles spent on the instruction fetch. See [MSRC001\\_1030](#).
- If the instruction fetch hit or missed the IC, hit/missed in the L1 and L2 TLBs, and page size. See [MSRC001\\_1030](#).
- The linear address, physical address associated with the fetch. See [MSRC001\\_1031](#), [MSRC001\\_1032](#).

Instruction execution performance is profiled by tagging one micro-op associated with an instruction. Instructions that decode to more than one micro-op return different performance data depending upon which micro-op associated with the instruction is tagged. These micro-ops are associated with the RIP of the next instruction to retire. The following performance information is returned for the tagged micro-op:

- Branch and execution status for micro-ops. See [MSRC001\\_1035](#).
- Branch target address for branch micro-ops. See [MSRC001\\_103B](#).
- The logical address associated with the micro-op. See [MSRC001\\_1034](#).
- The linear and physical address associated with a load or store micro-op. See [MSRC001\\_1038](#), [MSRC001\\_1039](#).
- The data cache access status associated with the micro-op: DC hit/miss, DC miss latency, TLB hit/miss, TLB page size. See [MSRC001\\_1037](#).
- The number clocks from when the micro-op was tagged until the micro-op retires. See [MSRC001\\_1035](#).
- The number clocks from when the micro-op completes execution until the micro-op retires. See [MSRC001\\_1035](#).
- Source information for DRAM, MMIO, L3 hit and state. See [MSRC001\\_1036](#).

## 2.8 Configuration Space

PCI-defined configuration space was originally defined to allow up to 256 bytes of register space for each function of each device; these first 256 bytes are called base configuration space (BCS). It was expanded to support up to 4096 bytes per function; bytes 256 through 4095 are called extended configuration space (ECS). The processor includes configuration space registers located in both BCS and ECS. Processor configuration space is accessed through bus 0, devices 18h to 1Fh, where device 18h corresponds to node 0 and device 1Fh corresponds to node 7. See [2.8.3 \[Processor Configuration Space\]](#).

Configuration space is accessed by the processor through two methods:

- IO-space configuration: IO instructions to addresses CF8h and CFCh.
  - Enabled through [IOCF8 \[IO-Space Configuration Address\]\[ConfigEn\]](#), which allows access to BCS.
  - Access to ECS enabled through [MSRC001\\_001F \[NB Configuration 1 \(NB\\_CFG1\)\]\[EnableCf8ExtCfg\]](#).
  - Use of IO-space configuration can be programmed to generate GP faults through [MSRC001\\_0015 \[Hardware Configuration \(HWCR\)\]\[IoCfgGpFault\]](#).
  - SMI trapping for these accesses is specified by [MSRC001\\_0054 \[IO Trap Control \(SMI\\_ON\\_IO\\_TRAP\\_CTL\\_STS\)\]](#) and [MSRC001\\_00\[53:50\] \[IO Trap \(SMI\\_ON\\_IO\\_TRAP\\_\[3:0\]\)\]](#).
- MMIO configuration: configuration space is a region of memory space.
  - The base address and size of this range is specified by [MSRC001\\_0058 \[MMIO Configuration Base Address\]](#). The size is controlled by the number of configuration-space bus numbers supported by the system. Accesses to this range are converted configuration space as follows:
    - Address[31:0] = {0h, bus[7:0], device[4:0], function[2:0], offset[11:0]}.

The BIOS may use either configuration space access mechanism during boot. Before booting the OS, BIOS must disable IO access to ECS, enable MMIO configuration and build an ACPI defined MCFG table. BIOS ACPI code must use MMIO to access configuration space.

Per the link specification, BCS accesses utilize link addresses starting at FD\_FE00\_0000h and ECS accesses utilize link addresses starting at FE\_0000\_0000h.

### 2.8.1 MMIO Configuration Coding Requirements

MMIO configuration space accesses must use the uncacheable (UC) memory type. Instructions used to read MMIO configuration space are required to take the following form:

```
mov eax/ax/al, <any_address_mode>;
```

Instructions used to write MMIO configuration space are required to take the following form:

```
mov <any_address_mode>, eax/ax/al;
```

No other source/target registers may be use other than eax/ax/al.

In addition, all such accesses are required not to cross any naturally aligned DW boundary. Access to MMIO configuration space registers that do not meet these requirements result in undefined behavior.

### 2.8.2 MMIO Configuration Ordering

Since MMIO configuration cycles are not serializing in the way that IO configuration cycles are, their ordering rules relative to posted may result in unexpected behavior.

Therefore, processor MMIO configuration space is designed to match the following ordering relationship that exists naturally with IO-space configuration: if a core generates a configuration cycle followed by a posted-write cycle, then the posted write is held in the processor until the configuration cycle completes. As a result, any unexpected behavior that might have resulted if the posted-write cycle were to pass MMIO configuration cycle is avoided.

### 2.8.3 Processor Configuration Space

The processor includes configuration space as described in [3 \[Registers\]](#). Accesses to unimplemented registers

of implemented functions are ignored: writes dropped; reads return 0's. Accesses to unimplemented functions also ignored: writes are dropped; however, reads return all F's. The processor does not log any master abort events for accesses to unimplemented registers or functions.

Accesses to device numbers of devices not implemented in the processor are routed based on the configuration map registers. If such requests are master aborted, then the processor can log the event.

## 2.9 Northbridge (NB)

Each node includes a single northbridge that provides the interface to the local core(s), the interface to system memory, the interface to other processors, and the interface to system IO devices. The NB includes all power planes except VDD; see 2.5.1 [Processor Power Planes And Voltage Control].

The NB of each node is responsible for routing transactions sourced from cores and links to the appropriate core, cache, DRAM, or link. See 2.4.5 [System Address Map].

### 2.9.1 NB Architecture

Major NB blocks are: System Request Interface (SRI), Memory Controller (MCT), DRAM Controllers (DCTs), L3 cache, and crossbar (XBAR). SRI interfaces with the core(s). MCT maintains cache coherency and interfaces with the DCTs; MCT maintains a queue of incoming requests called MCQ. XBAR is a switch that routes packets between SRI, MCT, and the links.

The MCT operates on physical addresses. Before passing transactions to the DCTs, the MCT converts physical addresses into *normalized* addresses that correspond to the values programmed into D18F2x[5C:40]\_dct[1:0] [DRAM CS Base Address]. Normalized addresses include only address bits within the DCTs' range. The normalized address varies based on DCT interleave and hoisting settings in D18F2x110 [DRAM Controller Select Low] and D18F2x114 [DRAM Controller Select High] as well as node interleaving based on D18F1x[17C:140,7C:40] [DRAM Base/Limit].

### 2.9.2 GART

Note: The GART has been deprecated for future use and new product development; it is supported only for compatibility with existing products.

The GART is a device that translates a range of physical address space, called the GART aperture, to a logical address based on page tables in system memory. The GART also includes a 16 entry cache for the page table translations. The registers that specify GART behavior are:

- D18F3x90 [GART Aperture Control].
- D18F3x94 [GART Aperture Base]
- D18F3x98 [GART Table Base]
- D18F3x9C [GART Cache Control]

Programming requirements:

- GART translations to addresses above 1 terabyte are not supported.
- The page table is required to reside within DRAM.
- The page table is required to be mapped to the UC memory type or be updated with strongly ordered UC stores.
- D18F3x90[DisGartTblWlkPrb] must be set to 1.
- The page tables are expected to translate to DRAM address ranges only; translations to MMIO ranges result in undefined behavior.

- The GART registers must be programmed to the same value for all nodes in the system.

### 2.9.3 NB Routing

There are two factors that affect how a transaction is routed:

1. Address space routing determines the destination node.
2. HyperTransport™ transaction routing determines the path in the coherent fabric that the transaction follows to reach the destination node.

#### 2.9.3.1 Address Space Routing

There are four main types of address space routed by the NB:

1. Memory space targeting system DRAM
2. Memory space targeting IO (MMIO)
3. IO space
4. Configuration space.

##### 2.9.3.1.1 DRAM and MMIO Memory Space

Core memory space transactions provide the NB with the physical address, cacheability type, access type, and DRAM/MMIO destination type as specified in section 2.4.5.1.2 [Determining The Access Destination for Core Accesses].

Memory-space transactions are handled by the NB as follows:

- If the physical address matches against the AGP-aperture (D18F3x90, D18F3x94), then the physical address is translated through the AGP GART. The AGP aperture match ignores the access DRAM/MMIO destination and overrides any match to D18F1x[17C:140,7C:40] [DRAM Base/Limit], and D18F1x[1CC:180,BC:80] [MMIO Base/Limit].
  - For accesses from IO devices, the cacheability attribute from the GART entry's "Coherent" bit, as specified in D18F3x98[GartTbIBaseAddr], is applied.
    - Upstream IO accesses to the GART aperture are affected by MSRC001\_0015[ForceRdWrSzPrb].
  - For accesses from a CPU, the attribute already applied by the core is used and the GART entry's "Coherent" bit is ignored.
    - System software should ensure that the cacheability attribute assigned to an AGP aperture matches the "Coherent" bit in the matching GART entry.
- IO-device accesses that do not match the AGP aperture and post-GART translated addresses are compared against:
  - If the access matches D18F1x[1CC:180,BC:80] [MMIO Base/Limit], then the transaction is routed to the specified link;
  - Else, if the access matches D18F1x[17C:140,7C:40] [DRAM Base/Limit], then the access is routed to the specified link or DCT;
  - Else, the access is routed to the node or link that contains compatibility (subtractive) address space, specified by D18F0x60[SbNode] and D18F0x64[SbLink].
- For core accesses the routing is determined based on the DRAM/MMIO destination:
  - If the destination is DRAM:
    - If the access matches D18F1x[17C:140,7C:40] [DRAM Base/Limit], then the transaction is routed to the specified link;
    - Else, the access is routed to the node or link that contains compatibility (subtractive) address space, specified by D18F0x60[SbNode] and D18F0x64[SbLink].
  - If the destination is MMIO:
    - If the access matches the VGA-compatible MMIO address space and D18F1xF4[VE]=1 then D18F1xF4 describes how the access is routed and controlled;

- Else, If the access matches [D18F1x\[1CC:180,BC:80\] \[MMIO Base/Limit\]](#), then the transaction is routed to the specified link;
- Else, the access is routed to the node or link that contains compatibility (subtractive) address space, specified by [D18F0x60\[SbNode\]](#) and [D18F0x64\[SbLink\]](#).

### 2.9.3.1.2 IO Space

IO-space transactions from IO links or cores are routed as follows:

- If the access matches [D18F1x\[DC:C0\] \[IO-Space Base/Limit\]](#), then the transaction is routed to the specified link;
- Else, If the access matches the VGA-compatible IO address space and [D18F1xF4\[VE\]=1](#) then [D18F1xF4](#) describes how the access is routed and controlled.
- Else, the access is routed to the node or link that contains compatibility (subtractive) address space, specified by [D18F0x60\[SbNode\]](#) and [D18F0x64\[SbLink\]](#).

### 2.9.3.1.3 Configuration Space

Configuration-space transactions from IO links are master aborted. Configuration-space transactions from cores are routed as follows:

- If the access targets the configuration space of an existing node (based on the configuration-space address and [D18F0x60\[NodeCnt\]](#)), then it is routed to that node.
- Else, if the access matches [D18F1x\[EC:E0\] \[Configuration Map\]](#), then the transaction is routed to the specified link;
- Else, the access is routed to the node or link that contains compatibility (subtractive) address space, specified by [D18F0x60\[SbNode\]](#) and [D18F0x64\[SbLink\]](#).

### 2.9.3.2 HyperTransport™ Technology Routing

There are three types of HyperTransport™ transactions routed by the NB: (1) broadcast transactions, (2) request transactions, and (3) response transactions. The NB includes routing registers for each node that specify the link to route each transaction type accessed through [D18F0x\[5C:40\] \[Routing Table\]](#).

[Figure 5](#) through [Figure 7](#) show the supported topologies for G34 processors. The links between internal nodes are described in [2.12.1.5 \[Link Mapping Between Package and Node\]](#). The IO hub must be connected to internal node 0.

[Figure 5](#) shows the supported two processor topology for G34r1 processors. For the link connections between the two processors, the thick lines represent 16-bit links and the thin lines represent 8-bit links. Optionally, the 16-bit links may be swapped with the 8 bit links. The links between internal nodes are described in [2.12.1.5 \[Link Mapping Between Package and Node\]](#).

**Figure 5: Two Processor G34r1 Topology**

Figure 6 shows the supported four processor topology for G34r1 processors with two 16-bit IO links. This topology provides maximum performance. Figure 7 shows the supported four processor topology for G34r1 processors with four 16-bit IO links. This topology provides maximum IO. The links between processors are all 8-bits.

**Figure 6: Four Processor G34r1 Maximum Performance Topology**

**Figure 7: Four Processor G34r1 Maximum IO Topology**

### 2.9.3.2.1 Routing Table Configuration

The routing table registers must be configured correctly in multi-node systems to ensure that probes are only delivered once to each node and to ensure that the routing table is deadlock free.

A routing table is deadlock free if it contains no open-paths and no two-hop cycles.

An open-path is a routing path between nodes that traverse one or more nodes that contains a subpath that is not a routing path in the routing table. For example if the routing path between nodes 0 and 2 in [Figure 8](#) was Node 0->Node 1->Node 3->Node 2 and the routing path between Nodes 3 and 2 was not Node 3->Node 2 then the routing path between Nodes 0 and 2 would be open because the subpath Node 3->Node 2 is not a path in the routing table.

**Figure 8: Sample Four-Node Configuration**

A two-hop cycle is a group of two hop routing paths (routing paths between two nodes that pass through a third node) such that the first and second nodes in the each two hop routing path are also the second and third nodes in a two hop routing path in the group.

Consider the four node configuration shown in [Figure 8](#). A two-hop cycle would occur in this configuration if the routing table was configured with the following routing paths:

- The routing path from Node 0 to Node 3 is: Node 0->Node 1->Node 3.

- The routing path from Node 1 to Node 2 is: Node 1->Node 3->Node 2.
- The routing path from Node 2 to Node 1 is: Node 2->Node 0->Node 1.
- The routing path from Node 3 to Node 0 is: Node 3->Node 2->Node 0.

To break this cycle at least one but no more than three of these routing paths must be modified to use a different intermediate node. Reconfiguring the routing paths as follows eliminates the 2-hop cycle.

- The routing path from Node 0 to Node 3 is: Node 0->Node 1->Node 3.
- The routing path from Node 1 to Node 2 is: Node 1->Node 3->Node 2.
- The routing path from Node 2 to Node 1 is: Node 2->Node 0->Node 1.
- The routing path from Node 3 to Node 0 is: Node 3->Node 1->Node 0.

### 2.9.3.2.2 NodeId Enumeration Requirements for Dual-node Processors

The assignment of [D18F0x60](#)[NodeId] in a dual-node processor system, identified by [D18F3xE8](#)[MultiNodeCpu], is performed starting with the node containing the BSC. The BSC node by definition has NodeId=0. The other internal node in that dual-node processor is assigned NodeId=1. See [D18F0x1A0](#)[IntLnkRoute] for how to identify the internal nodes in a dual-node processor. The remaining NodeId's in the system must be assigned using the following rules:

- Internal nodes must be assigned NodeId's in even/odd pairs. A pair of NodeId's consists of N and N+1 where N is an even integer.
- NodeId's must be assigned contiguously. For example, node ID assignment {0, 1, 2, 3} is allowed but {0, 1, 4, 5} is not.

For example, consider a 3 processor system consisting of dual-node processors A, B, and C where internal node 1 of processor B contains the BSC. A valid NodeId assignment would be:

| NodeId | Processor | <a href="#">D18F3xE8</a> [IntNodeNum] |
|--------|-----------|---------------------------------------|
| 0      | B         | 1                                     |
| 1      | B         | 0                                     |
| 2      | A         | 0                                     |
| 3      | A         | 1                                     |
| 4      | C         | 1                                     |
| 5      | C         | 0                                     |

### 2.9.3.2.3 BIOS Requirements for Systems with Mixed Processor Families

Processors that are not covered by this document are not supported on coherent links by processors covered by this document. BIOS must ensure that all nodes in the coherent fabric are processors covered by this document by reading [D18F3xFC](#) [CPUID Family/Model/Stepping] before initializing the node. If a node that is not a processor covered by this document is discovered, BIOS must configure the BSP routing tables as a single processor system.

The BIOS may continue the boot process in order to display an error message on the screen if the BSP has DRAM attached and the display adapter is connected to an IO link accessible to the BSP. If these conditions are not met the BIOS may signal an error in a implementation specific manner. The BIOS must not continue the boot process after the error has been reported.

### 2.9.3.2.4 Link Traffic Distribution

Link traffic distribution is a mechanism to reduce coherent link congestion by distributing the traffic over mul-

multiple links. There are two supported modes for link traffic distribution and BIOS must ensure that only one mode is enabled in a system. See 2.9.3.2.4.1 [Coherent Link Traffic Distribution] and 2.9.3.2.4.2 [Coherent Link Pair Traffic Distribution].

See 2.9.3.2.4.3 [Victim Distribution Mode].

#### 2.9.3.2.4.1 Coherent Link Traffic Distribution

Coherent link traffic distribution supports a 2-node systems in which multiple coherent links (2 or 3) are connected between the nodes in order to increase bandwidth between them. All links between the two nodes should be the same width (either 16-bit ganged links or 8-bit unganged sublinks). This mode is enabled by D18F0x164 [Coherent Link Traffic Distribution]. The following requirement must be met:

- For all virtual channels that are enabled for distribution, the corresponding routing table entry in D18F0x[5C:40] is required to select one of the links specified for distribution in D18F0x164[DstLnk].

#### 2.9.3.2.4.2 Coherent Link Pair Traffic Distribution

Coherent link pair traffic distribution supports up to four coherent link groupings among two or more nodes in a system. This mode is enabled by D18F0x1E0 [Coherent Link Pair Traffic Distribution]. Each link group consists of a pair of coherent links between two nodes. One of the links in the link pair is designated as the master link and the other link is designated as the alternate link. The coherent link pair can be either symmetric (same width) or asymmetric (different width). The following requirements must be met:

- For an asymmetric link pair, the master link must be the larger link.
- The master link is specified and the alternate link is not specified in D18F0x[5C:40].

#### 2.9.3.2.4.3 Victim Distribution Mode

Victim distribution mode is a way to direct victim traffic on to ganged links and away from unganged links as a way to reduce unganged link congestion.

Victim distribution mode is enabled for a system only if all of the following are true:

- 2 processor (4 node) G34 system.

Victim distribution mode is enabled on a node only if all of the following are true:

- Victim distribution mode is enabled for the system.
- The node connects to another node directly with only 1 unganged link hop and indirectly through 2 ganged link hops.

A node that enables victim distribution mode is programmed as follows:

- D18F0x164[cHTVicDistMode]=1.
- D18F0x164[DstNode] is set to the node that is 2 ganged link hops from this node. Victims not to this node will be directed as normal.
- D18F0x164[cHTPrbDistEn]=0; D18F0x164[cHTRspDistEn]=1; D18F0x164[cHTReqDistEn]=1.
- D18F0x164[DstLnk] is the ganged link to the node that is halfway to D18F0x164[DstNode].
- If there are 2 ganged links where there are 2 ganged link hops to DstNode, then DstLnk must be set such that victim traffic from only 1 node must travel on a link in the same direction. See Figure 9; boxes are nodes; thick is a ganged link; thin is an unganged link. Either of the following schemes are acceptable:
  - Horizontal then vertical:
    - Node 0 -> Node 1 -> Node 2. (Node0: DstLnk=a, DstNode=2)
    - Node 1 -> Node 0 -> Node 3. (Node1: DstLnk=a, DstNode=3)
    - Node 2 -> Node 3 -> Node 0. (Node2: DstLnk=c, DstNode=0)
    - Node 3 -> Node 2 -> Node 1. (Node3: DstLnk=c, DstNode=1)
  - Vertical then horizontal:
    - Node 0 -> Node 3 -> Node 2. (Node0: DstLnk=d, DstNode=2)

- Node 1 -> Node 2 -> Node 3. (Node1: DstLnk=b, DstNode=3)
- Node 2 -> Node 1 -> Node 0. (Node2: DstLnk=b, DstNode=0)
- Node 3 -> Node 0 -> Node 1. (Node3: DstLnk=d, DstNode=1)
- For the G34r1 package, the external 8 bit link that is marked as ganged for performance reasons with a disabled internal 8 bit internal link should not be eligible for victim distribution. See [2.12.1.5 \[Link Mapping Between Package and Node\]](#).

**Figure 9: Example 4-Node System in Full Topology**

### 2.9.3.2.5 Display Refresh And IFCM

*Display refresh* traffic is traffic generated by UMA graphics chipsets. It targets system memory for the purpose of refreshing the display. Link display refresh packets are defined as follows:

1. IO-initiated, non-posted read requests with the isochronous bit, PassPW bit, and RespPassPW bit set, and the coherent bit cleared. The SeqID must be zero and the request must be addressed outside the GART aperture.
2. The corresponding response to these requests.

The NB prioritizes these packets such that display refresh latency and bandwidth goals may be met. To support display refresh traffic, [D18F0x68 \[Link Transaction Control\]](#)[DispRefModeEn] is set.

Alternatively, if supported by the chipset, link-defined isochronous flow control mode (IFCM) may be employed. IFCM is enabled through [D18F0x\[E4,C4,A4,84\] \[Link Control\]](#)[IsocEn]. If this bit is set for any link, then [D18F0x68](#)[DispRefModeEn] must be clear.

- The processor does not support peer-to-peer accesses in isochronous virtual channels. Upstream isochronous requests that target IO space are passed to the IO device in the base channel (the Isoc bit in the request packet is low); however, the Isoc bit in the downstream response to the requester is still set in such a case.
- In non-IFCM, the link-defined Isoc bit in the request packet is cleared as it is reflected downstream in a peer-to-peer access as well.

See [D18F0x\[F0,D0,B0,90\] \[Link Base Channel Buffer Count\]](#), [D18F3x6C \[Data Buffer Count\]](#), [D18F3x70 \[SRI to XBAR Command Buffer Count\]](#), and [D18F3x74 \[XBAR to SRI Command Buffer Count\]](#) for IFCM buffer requirements and [D18F3x140 \[SRI to XCS Token Count\]](#) for IFCM and display refresh token requirements.

If an IOMMU is present on a link, IFCM must be enabled for that link.

### 2.9.3.2.5.1 Recommended Buffer Count Settings Overview

When changing from the recommended settings, see the register programming requirements in the definition of each register. Some chipsets may further optimize these settings for their platform. If values other than the recommended settings are used, see the register requirements in the definition of each register. [Table 23](#) defines commonly used terms for the following tables.

**Table 23: Link Definitions**

| Term                 | Definition  |
|----------------------|---|
| <b>Gen1</b>          | Refers to older revisions of the link specification and, in particular, link data rates from 0.4 to 2.0 GT/s. See <a href="#">2.12 [Links]</a> .  |
| <b>Gen3</b>          | Refers to link data rates from 2.4 to 6.4GT/s, as specified by revision 3.00 of the link specification. See <a href="#">2.12 [Links]</a> . Gen3 = ( $\{D18F0x[FC,DC,BC,9C][Freq[4]], D18F0x[E8,C8,A8,88][Freq[3:0]]\} \geq 7h$ ). |
| <b>G34r1</b>         | G34r1 package. G34r1 = (CPUID Fn8000_0001_EBX[PkgType]==0011b).   |
| <b>C32r1</b>         | C32r1 package. C32r1 = (CPUID Fn8000_0001_EBX[PkgType]==0101b).   |
| <b>AM3r2</b>         | AM3r2 package. AM3r2 = (CPUID Fn8000_0001_EBX[PkgType]==0001b).   |
| <b>SCM</b>           | 1 or 2 C32r1 sockets or 1 AM3r2 socket. SCM = (C32r1   AM3r2).  |
| <b>MCM1</b>          | 1 G34r1 socket.   |
| <b>MCM2h</b>         | 2 G34r1 socket half populated. See <a href="#">Figure 5: [Two Processor G34r1 Topology]</a> .   |
| <b>MCM2</b>          | 2 G34r1 socket fully populated. See <a href="#">Figure 5: [Two Processor G34r1 Topology]</a> .  |
| <b>MCM4h</b>         | 4 G34r1 socket half populated. See <a href="#">Figure 6: [Four Processor G34r1 Maximum Performance Topology]</a> and <a href="#">Figure 6: [Four Processor G34r1 Maximum Performance Topology]</a> .                              |
| <b>MCM4</b>          | 4 G34r1 socket fully populated. See <a href="#">Figure 6: [Four Processor G34r1 Maximum Performance Topology]</a> and <a href="#">Figure 6: [Four Processor G34r1 Maximum Performance Topology]</a> .                             |
| <b>LinkConnected</b> | LinkConnected = D18F0x[F8,D8,B8,98][LinkCon].   |
| <b>LinkGang</b>      | Ganged = D18F0x[17C:170][Ganged]. See D18F0x[18C:170][Ganged].  |
| <b>IoLink</b>        | IoLink = D18F0x[F8,D8,B8,98][NC].   |
| <b>NoIoLink</b>      | Indicates that none of the links are configured as an IO link.  |
| <b>IOMMU</b>         | Indicates the presence of an IOMMU device on the IOH. IOMMU uses the isochronous flow control channel. If an IOMMU is present, D18F0x[E4,C4,A4,84][IsocEn] must be set for all links.   |
| <b>IFCM</b>          | Isochronous Flow Control Mode. IFCM = D18F0x[E4,C4,A4,84][IsocEn].  |
| <b>NFCM</b>          | Non-Isochronous Flow Control Mode. NFCM = ~IFCM & ~D18F0x68[DispRefModeEn].   |
| <b>UmaDr</b>         | UMA Display Refresh. UmaDr = D18F0x68[DispRefModeEn].   |
| <b>UmaIfcm</b>       | UmaIfcm = ~D18F0x68[DispRefModeEn] & IFCM & D18F3x158[LnkToXcsDRToken] != 0.  |
| <b>NonUmaIfcm</b>    | NonUmaIfcm = ~D18F0x68[DispRefModeEn] & IFCM & ~D18F3x158[LnkToXcsDRToken].   |
| <b>IoUnganged</b>    | IoUnganged = IoLink & ~LinkGang.  |
| <b>CohGanged</b>     | CohGanged = ~IoLink & LinkGang & ~IOMMU.  |
| <b>CohIommu</b>      | CohIommu = ~IoLink & LinkGang & IOMMU.  |

**Table 23: Link Definitions**

| Term               | Definition   |
|--------------------|--|
| <b>CohUnganged</b> | CohUnganged = $\sim$ IoLink & $\sim$ LinkGang.   |
| <b>32Byte</b>      | 32 byte, and optionally 64 byte, display refresh requests are generated by the graphics engine. $\sim$ 32byte indicates that only 64 byte display refresh requests are generated by the graphics engine.   |
| <b>MultiLink</b>   | More than 1 link exists. MultiLink = (D18F0x80[CapPtr] != 00h). See D18F0x[E0,C0,A0,80]. Multilink does not indicate whether more than 1 link is connected.  |
| <b>SingleLink</b>  | Only 1 link exists and is by definition the IO link. SingleLink = (D18F0x80[CapPtr] == 00h). See D18F0x[E0,C0,A0,80].  |
| <b>ProcCnt</b>     | Number of processors. After BIOS initializes D18F0x60[NodeCnt], ProcCnt is D18F0x60[NodeCnt]/2 for G34 MCM and D18F0x60[NodeCnt] otherwise. ProcCnt = (G34r1 ? (D18F0x60[NodeCnt]/2) : D18F0x60[NodeCnt]). |
| <b>PrbFltrEn</b>   | Probe filter is enabled. PrbFltrEn = (D18F3x1D4[PFMode] != 00b).   |
| <b>LinkFreq</b>    | Link frequency in MHz. LinkFreq = {D18F0x[FC,DC,BC,9C][Freq[4]], D18F0x[E8,C8,A8,88][Freq[3:0]]}.  |

### 2.9.4 The Level 3 Cache (L3)

The NB includes an L3 cache.

**Table 24: L3 Controller Definitions**

| Term           | Definition                                  |
|----------------|---|
| <b>L3qSize</b> | L3 command buffer queue size. L3qSize = 32. |

#### 2.9.4.1 Probe Filter

The probe filter provides filtering of broadcast probes to improve link bandwidth and performance for multi-node systems. It uses a portion of the L3 data cache as a directory to track cache lines in the system. The probe filter directory on each node tracks addresses mapped to the local DRAM on that node. The probe filter is enabled by programming D18F3x1D4 [Probe Filter Control] according to 2.9.4.2 [Probe Filter and ATM Mode Initialization Sequence].

Probe filter configuration requirements:

- The probe filter is supported only for multiple node systems.
- The probe filter is recommended to be enabled if 2 nodes and the MEMCLK frequency for all DCTs in the system is at least 533 MHz.
- The probe filter is recommended to be enabled if  $\geq 3$  nodes.
- The probe filter should be enabled or disabled on all nodes in the system.
- The 8-way probe filter must only be enabled if the total L3 capacity on a node (prior to enabled the probe filter) is equal to 8 MB and no subcache is less than 2 MB.

See 2.9.4.2 [Probe Filter and ATM Mode Initialization Sequence].

### 2.9.4.1.1 Probe Filter Errors

The L3 data cache used to store probe filter directory data is ECC protected. Single-bit (correctable) errors are corrected and logged in [D18F3x4C \[MCA NB Status High\]](#). Multi-bit (uncorrectable) errors are logged in [D18F3x4C](#), and the faulty probe filter location is no longer used. The directory is periodically scrubbed and the L3 scrubber may be redirected to scrub a location on correctable errors.

Uncorrectable ECC errors in the directory are not fatal, do not set [D18F3x4C\[UC\]](#), and do not cause machine check exceptions, but the directory entry is no longer reliable. The L3 reports uncorrectable ECC errors to the probe filter. Once such an error occurs, the faulty location index in the directory is no longer used and all requests which map to that index issue broadcast probes. [D18F3x1D4\[PF EccError\]](#) is set on an uncorrectable ECC error and can only be cleared by software. An interrupt may be generated on uncorrectable ECC errors by configuring [D18F3x1D4\[PF ErrInt\]](#). An interrupt may be generated on uncorrectable ECC errors by configuring [D18F3x1D4\[PF ErrInt\]](#).

### 2.9.4.2 Probe Filter and ATM Mode Initialization Sequence

Perform the following steps to enable the probe filter or enable ATM mode:

1. BSC: Disable the L3 and DRAM scrubbers on all nodes in the system:
  - [D\[1F:18\]F3x58\[L3Scrub\]](#)=00h.
  - [D\[1F:18\]F3x58\[DRAMScrub\]](#)=00h.
  - [D\[1F:18\]F3x5C\[ScrubReDirEn\]](#)=0.
2. BSC: Wait 40us for outstanding scrub requests to complete.
3. All cores in the system: Allowed to be done sequentially. Disable all cache activity in the system and empty caches for all active cores in the system:
  - A. IF ([MSRC001\\_102B\[CombineCr0Cd\]](#)==0) THEN [MSRC001\\_102B\[CombineCr0Cd\]](#)=1. ENDIF.
  - B. [CR0\[CD\]](#)=1.
  - C. Issue WBINVD.
  - D. If (probe filter configuration needs to be enabled) then [MSRC001\\_102A\[ProbeFilterSupEn\]](#)=1.
4. BSC: Change configuration state for all active nodes:
  - Perform the following if the probe filter configuration needs to be enabled:
    1. The following register settings must be used in systems where the probe filter is enabled. There is no implied ordering for the following settings.
      - [D\[1F:18\]F2x1B0\[CohPrefPrbLmt\]](#)=000b.
    2. Set [D\[1F:18\]F3x1C4\[L3TagInit\]](#)=1.
    3. Wait for [D\[1F:18\]F3x1C4\[L3TagInit\]](#)==0.
    4. Initialize [D18F3x1D4](#):
      - [D\[1F:18\]F3x1D4\[PFMode\]](#): BIOS: IF ([D18F3x1C4\[15:0\]](#)==CCCCCh) THEN 11b ELSE 10b ENDIF.
      - [D\[1F:18\]F3x1D4\[PFWayNum\]](#): BIOS: 10b.
      - [D\[1F:18\]F3x1D4\[PFSubCacheSize0, PFSubCacheSize1, PFSubCacheSize2, PFSubCacheSize3\]](#): BIOS: IF ([D18F3x1C4\[15:0\]](#)==CCCCCh) THEN 01b ELSE 00b ENDIF.
      - [D\[1F:18\]F3x1D4\[PFSubCacheEn\]](#): BIOS: Fh.
      - [D\[1F:18\]F3x1D4\[PFWayHashEn\]](#): BIOS: 1.
      - [D\[1F:18\]F3x1D4\[PFPreferredSOREpl\]](#): BIOS: IF ([D18F3x1C4\[15:0\]](#)==CCCCCh) THEN 10b ELSE 00b ENDIF.
      - [D\[1F:18\]F3x1D4\[PFLoIndexHashEn\]](#): BIOS: 1.
    5. Wait for [D\[1F:18\]F3x1D4\[PFInitDone\]](#)==1. // PF directory init is complete.
  - Perform the following if the ATM configuration needs to be enabled:
    1. [D\[1F:18\]F0x68\[ATMMModeEn\]](#)=1.
    2. [D\[1F:18\]F3x1B8\[L3ATMMModeEn\]](#)=1.

5. All cores in sequence: Enable all cache activity in the system by clearing CR0[CD] for all active cores in the system. Leave [MSRC001\\_102B](#)[CombineCr0Cd]=1 on all active cores.
6. BSC: Restore L3 and DRAM scrubber register values on all nodes in the system as modified by step 1.

### 2.9.4.3 L3 Cache Partitioning

In order to minimize the displacement of L3 data of one compute unit by another compute unit, L2 victim traffic from each compute unit can be directed to a specified set of subcaches of the L3; see [D18F4x1D4](#) [Compute Unit Based L3 Cache Partitioning]. See [D18F3x1C4](#) for the size of each of the 4 L3 subcaches. This mechanism will direct L2 victims according to [D18F4x1D4](#). [D18F4x1D4](#) can be configured while L2 victims exist and are being generated. L2 victim traffic existing or generated at the time that [D18F4x1D4](#) is configured may not obey the updated configuration; all or nearly all L2 victim traffic existing or generated after the time that [D18F4x1D4](#) is configured will obey the updated configuration.

Programming requirements:

- Both BAN and L3 cache partitioning are methods to influence L3 allocation policy, they interfere with each other, and thus are not recommended to be enabled simultaneously. Before L3 cache partitioning is enabled for any compute unit via [D18F4x1D4](#), BAN mode is recommended to be disabled by ([D18F3x1B8](#)[L3BanMode]==00b).
- There are no restrictions for cache state or activity that can be in flight at the time of the configuration writes.
- The configuration of L3 cache partitioning and BAN mode is node specific and may vary by node.

### 2.9.5 Memory Scrubbers

The processor includes memory scrubbers specified in [D18F3x58](#) [Scrub Rate Control], [D18F3x5C](#), and [D18F3x60](#). The scrubbers ensure that all cachelines in memory within or connected to the processor are periodically read and, if correctable errors are discovered, they are corrected. The system memory scrubber is also employed as specified in [D18F3xB0](#) [On-Line Spare Control][SwapEn0].

For recommendations on scrub rates, see [2.13.1.8](#) [Scrub Rate Considerations].

The scrub rate is specified as the time between successive scrub events. A scrub event occurs when a line of memory is checked for errors; the amount of memory that is checked varies based on the memory block (see field descriptions).

The time required to fully scrub the memory of a node is determined as:

- Time = ((memory size in bytes)/64) \* (Scrub Rate).
- E.g. If a node contains 1GB of system memory and [DramScrub](#)=5.24 ms, then all of the system memory of the node is scrubbed about once every 23 hours.

### 2.10 DRAM Controllers (DCTs)

The processor includes two DRAM controllers (DCTs). Each DCT controls one 64-bit DDR3 DRAM channel. A DRAM channel consists of the group of DRAM interface pins connecting to one series of DIMMs.

BIOS reads [D18F5x84](#)[DctEn] and [D18F3xE8](#)[MultiNodeCpu] to determine the DCT to DDR channel mapping as follows:

- For single-node products, DCT0 and DCT1 respectively control channels A and B.
- For dual-node products, DCT0 and DCT1 of internal node 0 respectively control channels A and B. DCT0 and DCT1 of internal node 1 respectively control channels C and D.

The DCTs operate on normalized addresses corresponding to the values programmed into the [D18F2x\[5C:40\]\\_dct\[1:0\] \[DRAM CS Base Address\]](#). Normalized addresses only include address bits within a DCT's range. The physical to normalized address translation varies based on DCT interleave and hoisting settings. See [2.10.6 \[Memory Interleaving Modes\]](#) and [2.10.7 \[Memory Hoisting\]](#).

The following restrictions limit the DIMM types and configurations supported by the DCTs:

- All DIMMs connected to a node are required to operate at the same MEMCLK frequency, regardless of the channel. Both DCTs must be programmed to the same frequency.
- Mixing of unbuffered, registered, and/or load reduced DIMMs within a system is not supported.
- Mixing of ECC and non-ECC DIMMs within a system is not supported.

The tables below list the maximum DIMM speeds supported by the processor for different configurations. The motherboard should comply with the relevant AMD socket motherboard design guideline (MBDG) to achieve the rated speeds. In cases where MBDG design options exist, lower-quality options may compromise the maximum achievable speed; motherboard designers should assess the tradeoffs.

**Table 25: DCT Definitions**

| Term                             | Definition   |
|----------------------------------|--|
| <b>SR</b>                        | Single Rank  |
| <b>DR</b>                        | Dual Rank  |
| <b>QR</b>                        | Quad Rank  |
| <b>LR</b>                        | Load Reduced DIMM  |
| <b>MRS</b>                       | JEDEC defined DRAM Mode Register Set.  |
| <b>NP</b>                        | No DIMM populated  |
| <b>DIMM0</b>                     | DIMM slots 0-n. The DIMMs on each channel are numbered from 0 to n where DIMM0 is the DIMM closest to the processor on that channel and DIMMn is the DIMM farthest from the processor on that channel. |
| <b>DIMM1</b>                     |  |
| <b>DIMM2</b>                     |  |
| <b>DIMM</b>                      | The DIMM being configured  |
| <b>Rank</b>                      | The rank being configured  |
| <b>NumRegisters</b>              | The number of registers on the DIMM being configured.  |
| <b>NumDimmSlots</b>              | The number of motherboard DIMM slots per channel   |
| <b>DramCapacity</b>              | SPDByte[4][3:0] of the DIMM being configured.  |
| <b>RankMap</b>                   | SPDByte[63][0] of the DIMM being configured.   |
| <b>NumRanks</b>                  | SPDByte[7][5:3] of the DIMM being configured.  |
| <b>DeviceWidth</b>               | SPDByte[7][2:0] of the DIMM being configured.  |
| <b>AutoSelfRefresh</b>           | SPDByte[31][2] of the DIMM being configured.   |
| <b>ExtendedTemperature-Range</b> | SPDByte[31][0] of the DIMM being configured.   |
| <b>MinimumModuleDelay</b>        | SPDByte[94, 92, 90][6:0], indexed by VDDIO, of the LRDIMM being configured.  |
| <b>MaximumModuleDelay</b>        | SPDByte[95, 93, 91][6:0], indexed by VDDIO, of the LRDIMM being configured.  |
| <b>DdrRate</b>                   | The DDR data rate (MT/s).  |
| <b>VDDIO</b>                     | DDR VDDIO in V.  |

**Table 25: DCT Definitions**

| Term          | Definition  |
|---------------|---|
| <b>UDIMM</b>  | SPDByte[3][3:0] == 2h. DCT is configured for UDIMM if (D18F2x90_dct[1:0][UnbuffDimm]==0) and any rank is (D18F2x[6C:60]_dct[1:0][RankDef]==0).  |
| <b>RDIMM</b>  | SPDByte[3][3:0] == 1h. DCT is configured for RDIMM if (D18F2x90_dct[1:0][UnbuffDimm]!=0) and any rank is (D18F2x[6C:60]_dct[1:0][RankDef]==0).  |
| <b>LRDIMM</b> | SPDByte[3][3:0] == Bh. DCT is configured for LRDIMM if (D18F2x90_dct[1:0][UnbuffDimm]!=0) and any rank is (D18F2x[6C:60]_dct[1:0][RankDef]!=0). |

**Table 26: DDR3 UDIMM Maximum Frequency Support for G34**

| DIMM Slots/Ch | DIMMs | DIMMs |    | Frequency <sup>1</sup> (MT/s) |       |       |
|---------------|-------|-------|----|-------------------------------|-------|-------|

1. Population restrictions (including the order for partially populated channels) may apply. See [Table 36](#).
2. The indicated frequencies represent the current plan; however, there is a possibility that these frequencies may improve by one speed grade.

The tables below list the DIMM populations as supported by the processor. DIMMs must be populated from farthest slot to closest slot to the processor on a per channel basis when a daisy chain topology is used. DIMMs are populated on the outer slots first on a 3 DIMM/Ch tee or star topology.

**Table 33: DDR3 UDIMM Population Support G34/C32**

| DIMM Slots/Ch | DIMM0 | DIMM1 | DIMM2 |
|---------------|-------|-------|-------|

|               | SR/DR | SR/DR |

### 2.10.1 DCT Configuration Registers

There are two types of DCT configuration registers:

- Registers for which there is one instance for all DCT's. E.g. [D18F2xAC](#) [DRAM Controller Temperature Status].
- Registers for which there is one instance per DCT. E.g. [D18F2x78\\_dct\[1:0\]](#) [DRAM Control].
  - For [D18F2x78\\_dct\[x\]](#),  $x = \text{D18F1x10C}[\text{DctCfgSel}]$ ; see [D18F1x10C](#) [DctCfgSel].
  - The syntax for this register type is described by example as follows:
    - [D18F2x78\\_dct\[1:0\]](#) refers to all instances of the D18F2x78 register.
    - [D18F2x78\\_dct\[1\]](#) refers to the D18F2x78 register instance for DCT1.

### 2.10.2 DDR Pad to Processor Pin Mapping

The relationship of pad drivers to processor pins varies by package as shown in the following table.

Table 37: Package pin mapping

| Pad  | Pin                      |                          |             |             |
|--|--------------------------|--------------------------|-------------|-------------|
|  | G34r1<br>Internal Node 0 | G34r1<br>Internal Node 1 | C32r1       | AM3r2       |
| MEMCLK0_H[0]   | MA_CLK_H[0]              | MC_CLK_H[0]              | MA_CLK_H[0] | MA_CLK_H[2] |
| MEMCLK0_H[1]   | MA_CLK_H[1]              | MC_CLK_H[1]              | MA_CLK_H[1] | MA_CLK_H[4] |
| MEMCLK0_H[2]   | MA_CLK_H[2]              | MC_CLK_H[2]              | MA_CLK_H[2] | MA_CLK_H[5] |
| MEMCLK0_H[3]   | MA_CLK_H[3]              | MC_CLK_H[3]              | MA_CLK_H[3] | MA_CLK_H[3] |
| MEMCLK0_H[4]   | MA_CLK_H[4]              | MC_CLK_H[4]              | -           | -           |
| MEMCLK0_H[5]   | -                        | -                        | -           | -           |
| MEMCLK1_H[0]   | MB_CLK_H[0]              | MD_CLK_H[0]              | MB_CLK_H[0] | MB_CLK_H[2] |
| MEMCLK1_H[1]   | MB_CLK_H[1]              | MD_CLK_H[1]              | MB_CLK_H[1] | MB_CLK_H[4] |
| MEMCLK1_H[2]   | MB_CLK_H[2]              | MD_CLK_H[2]              | MB_CLK_H[2] | MB_CLK_H[5] |
| MEMCLK1_H[3]   | MB_CLK_H[3]              | MD_CLK_H[3]              | MB_CLK_H[3] | MB_CLK_H[3] |
| MEMCLK1_H[4]   | MB_CLK_H[4]              | MD_CLK_H[4]              | -           | -           |
| MEMCLK1_H[5]   | -                        | -                        | -           | -           |
| MEMCS0_L[0]  | MA0_CS_L[0]              | MC0_CS_L[0]              | MA0_CS_L[0] | MA0_CS_L[0] |
| MEMCS0_L[1]  | MA0_CS_L[1]              | MC0_CS_L[1]              | MA0_CS_L[1] | MA0_CS_L[1] |
| MEMCS0_L[2]  | MA1_CS_L[0]              | MC1_CS_L[0]              | MA1_CS_L[0] | MA1_CS_L[0] |
| MEMCS0_L[3]  | MA1_CS_L[1]              | MC1_CS_L[1]              | MA1_CS_L[1] | MA1_CS_L[1] |
| MEMCS0_L[4]  | MA2_CS_L[0]              | MC2_CS_L[0]              | MA0_CS_L[2] | -           |
| MEMCS0_L[5]  | MA2_CS_L[1]              | MC2_CS_L[1]              | MA0_CS_L[3] | -           |
| MEMCS0_L[6]  | MA3_CS_L[0]              | MC3_CS_L[0]              | MA1_CS_L[2] | -           |
| MEMCS0_L[7]  | MA3_CS_L[1]              | MC3_CS_L[1]              | MA1_CS_L[3] | -           |
| MEMCS1_L[0]  | MB0_CS_L[0]              | MD0_CS_L[0]              | MB0_CS_L[0] | MB0_CS_L[0] |
| MEMCS1_L[1]  | MB0_CS_L[1]              | MD0_CS_L[1]              | MB0_CS_L[1] | MB0_CS_L[1] |
| MEMCS1_L[2]  | MB1_CS_L[0]              | MD1_CS_L[0]              | MB1_CS_L[0] | MB1_CS_L[0] |
| MEMCS1_L[3]  | MB1_CS_L[1]              | MD1_CS_L[1]              | MB1_CS_L[1] | MB1_CS_L[1] |
| MEMCS1_L[4]  | MB2_CS_L[0]              | MD2_CS_L[0]              | MB0_CS_L[2] | -           |
| MEMCS1_L[5]  | MB2_CS_L[1]              | MD2_CS_L[1]              | MB0_CS_L[3] | -           |
| MEMCS1_L[6]  | MB3_CS_L[0]              | MD3_CS_L[0]              | MB1_CS_L[2] | -           |
| MEMCS1_L[7]  | MB3_CS_L[1]              | MD3_CS_L[1]              | MB1_CS_L[3] | -           |
| MEMODT0[0]   | MA0_ODT[0]               | MC0_ODT[0]               | MA0_ODT[0]  | MA0_ODT[0]  |
| MEMODT0[1]   | MA1_ODT[0]               | MC1_ODT[0]               | MA1_ODT[0]  | MA1_ODT[0]  |
| MEMODT0[2]   | MA2_ODT[0]               | MC2_ODT[0]               | MA0_ODT[1]  | MA0_ODT[1]  |
| MEMODT0[3]   | MA3_ODT[0]               | MC3_ODT[0]               | MA1_ODT[1]  | MA1_ODT[1]  |
| MEMODT1[0]   | MB0_ODT[0]               | MD0_ODT[0]               | MB0_ODT[0]  | MB0_ODT[0]  |
| MEMODT1[1]   | MB1_ODT[0]               | MD1_ODT[0]               | MB1_ODT[0]  | MB1_ODT[0]  |
| MEMODT1[2]   | MB2_ODT[0]               | MD2_ODT[0]               | MB0_ODT[1]  | MB0_ODT[1]  |
| MEMODT1[3]   | MB3_ODT[0]               | MD3_ODT[0]               | MB1_ODT[1]  | MB1_ODT[1]  |
| MEMCKE0[0]   | MA_CKE[0]                | MC_CKE[0]                | MA_CKE[0]   | MA_CKE[0]   |

| 1. For differential pins, only positive polarity pins are shown; negative polarity pins have corresponding mapping and are controlled by the same pad. |                          |                          |             |             |

### 2.10.3 DRAM Controller Direct Response Mode

The DCT supports direct response mode for responding to a cache line fill request before the DCT is initialized. In direct response mode, the target DCT responds to a cache line fill request by returning 64 bytes of all ones without issuing a read transaction on the DRAM bus. The BIOS uses this feature to allocate cache lines for temporary data storage. The controller exits direct response mode when either `D18F2x7C_dct[1:0][EnDr-amInit]` or `D18F2x90_dct[1:0][InitDr-am]` is set to 1.

See 2.10.5.7 [DRAM Device and Controller Initialization] and 2.3.3 [Using L2 Cache as General Storage During Boot].

### 2.10.4 DRAM Data Burst Mapping

DRAM requests are mapped to data bursts on the DDR bus in the following order:

- When `D18F2x110[DctDatIntLv]` = 0, a 64 B request is mapped to each of the eight sequential data beats as QW0, QW1...QW7.
- When `D18F2x110[DctDatIntLv]` = 1, the order of cache data to QW on the bus is the same except that even and odd bits are interleaved on the DRAM bus as follows:
  - For every 8 bytes in the cache line, even bits map to QW0, QW2, QW4, and QW6 on the DRAM bus.
  - For every 8 bytes in the cache line, odd bits map to QW1, QW3, QW5, and QW7 on the DRAM bus.

### 2.10.5 DCT/DRAM Initialization and Resume

DRAM initialization involves several steps in order to configure the DRAM controllers and the DRAM, and to tune the DRAM channel for optimal performance. DRAM resume requires several steps to configure the DCTs to properly resume from the S3 state. The following sequence describes the steps needed after a reset for initialization or resume. To disable an unused DRAM channel see 2.10.5.9 [DRAM Channel Disable].

1. Configure the DDR supply voltage regulator. See 2.10.5.1.
2. Force NB P-state to NBP0. See 2.10.5.2.
3. DDR phy initialization. See 2.10.5.3.
4. DRAM device and controller initialization.
  - If BIOS is booting from an unpowered state (ACPI S4, S5 or G3), then it performs the following:
    - a. Program SPD configuration. See 2.10.5.4.
    - b. Program Non-SPD configuration. See 2.10.5.5.
    - c. Program DCT training specific configuration. See 2.10.5.6.
    - d. Program the remaining DCT registers not covered by an explicit sequence dependency.
    - e. DRAM device initialization. See 2.10.5.7.
  - If BIOS is resuming the platform from S3 state, then it performs the following:
    - a. Restore all DCT and phy registers that were programmed during the first boot from non-volatile storage. See 2.10.5.4 and 2.10.5.5 for a review of registers.
    - b. Program `D18F2x90_dct[1:0][ExitSelfRef]` = 1.
    - c. Restore the trained delayed values (found during the initial boot in steps 5 and 6 below) from non-volatile storage.
    - d. Continue at step 8.
5. DRAM write levelization training. See 2.10.5.8.1.
6. DRAM data training.
  - A. DQS receiver enable training.
    - a. DQS receiver enable training. See 2.10.5.8.2
    - b. Program `D18F2x9C_x0D0F_E003_dct[1:0][DisAutoComp, DisablePredriverCal]` = {0b, 1b}.
    - c. DQS receiver enable cycle training. See 2.10.5.8.3.

- B. DQS position training. See 2.10.5.8.4.
- C. MaxRdLatency training. See 2.10.5.8.5.1.
- 7. NB P-state specific training. For each NB P-state from NBP1 to D18F5x170[NbPstateMaxVal]:
  - A. Force the NB P-state. See 2.10.5.2.
  - B. MaxRdLatency training. See 2.10.5.8.5.1.
- 8. Release NB P-state force. See 2.10.5.2.
- 9. Program DCT for normal operation. See 2.10.5.6.
- 10. Program DRAM phy for power savings. See 2.10.5.10.

The DRAM subsystem is ready for use.

### 2.10.5.1 Low Voltage DDR3

JEDEC defined DDR3L and DDR3U devices are supported. Platforms that support 1.35V or 1.25V operation should power on VDDIO at 1.35V until operating voltage is determined by reading the SPD ROM of all DIMMs. BIOS should not operate DIMMs at voltages higher than supported as indicated by SPD.

The recommended BIOS configuration sequence is as follows:

1. BIOS reads the SPD ROM of all DIMMs to determine the common operating voltage.
2. BIOS configures VDDIO to match the lowest common supported voltage based on the SPD values. See platform specific documentation for changing the voltage.
3. Additional derating of the DDR speed may be necessary for reliable operation at lower voltage. See 2.10 for information on voltage and electrical load specific maximum speed.

### 2.10.5.2 NB P-state Specific Configuration

A subset of DCT configuration and training must be repeated for each enabled NB P-state. To accomplish this, BIOS forces the processor to the desired NB P-state and releases the force once DRAM initialization and training is complete.

When D18F5x174[NbPstateDis]=0, BIOS performs the following to force the processor to the desired NB P-state:

1. Program the NB P-state specific configuration registers for the target NB P-state.
  - D18F2x210\_dct[1:0]\_nbp[3:0][MaxRdLatency, DataTxFifoWrDly, RdPtrInit].
2. Program D18F5x170 to transition the NB P-state:
  - SwNbPstateLoDis = NbPstateDisOnP0 = NbPstateThreshold = 0.
  - NbPstateLo = NbPstateMaxVal.
3. Wait for D18F5x174[CurNbPstate] to equal NbPstateLo.
4. Program D18F5x170 to force the NB P-state:
  - NbPstateHi = target NB P-state.
  - SwNbPstateLoDis = 1
5. Wait for D18F5x174[CurNbPstate] to equal the target NB P-state.

BIOS performs the following to release the NB P-state force:

6. Restore the initial D18F5x170[SwNbPstateLoDis, NbPstateDisOnP0] values.
7. Restore the initial D18F5x170[NbPstateThreshold, NbPstateHi] values.

See also 2.5.2.2 [NB P-states].

### 2.10.5.3 DDR Phy Initialization

The BIOS initializes the phy and the internal interface from the DCT to the phy, including the PLLs and the fence value, after each reset and for each time a MEMCLK frequency change is made.

BIOS obtains size, loading, and frequency information about the DIMMs and channels using SPDs prior to phy initialization. BIOS then performs the following actions:

1. Program `D18F2x9C_x0000_000B_dct[1:0]` = 80000000h.
2. Program `D18F2x9C_x0D0F_E013_dct[1:0]` = 0118h.
3. Phy Voltage Level Programming. See 2.10.5.3.1.
4. DRAM channel frequency change. See 2.10.5.3.2.
5. Phy fence programming. See 2.10.5.3.3.
6. Phy compensation initialization. See 2.10.5.3.4.

#### 2.10.5.3.1 Phy Voltage Level Programming

BIOS programs the following according to the desired phy VDDIO voltage level:

- Program `D18F2x9C_x0D0F_0[F,8:0]1F_dct[1:0][RxVioLvl]`.
- Program `D18F2x9C_x0D0F_[C,8,2][2:0]1F_dct[1:0][RxVioLvl]`.
- Program `D18F2x9C_x0D0F_4009_dct[1:0][CmpVioLvl, ComparatorAdjust]`.

See 2.10.5.1 [Low Voltage DDR3].

#### 2.10.5.3.2 DRAM Channel Frequency Change

The following sequence is used to change the DRAM frequency under all boot conditions, including restoring the DCT state when resuming from the S3 state:

For each DCT:

1. Program `D18F2x9C_x0D0F_E006_dct[1:0][PllLockTime]` = 190h.
2. Program `D18F2x94_dct[1:0][MemClkFreqVal]` = 0.
3. Program `D18F2x94_dct[1:0][MemClkFreq]` to the desired DRAM frequency.
4. Program the following parameters which must be configured prior to setting `MemClkFreqVal`:
  - `D18F2x90_dct[1:0][X4Dimm]`
  - `D18F2x94_dct[1:0][ProcOdtDis]`
  - `D18F2x9C_x0000_0004_dct[1:0]`
  - `D18F2x9C_x0D0F_0[F,8:0]13_dct[1:0][ProcOdtAdv]`
  - `D18F2x9C_x0D0F_E00A_dct[1:0][SkewMemClk]`
  - `D18F2x210_dct[1:0]_nbp[3:0][RdPtrInit, DataTxFifoWrDly]` of the current NB P-state for the target MEMCLK frequency. See also 2.10.5.2.

For each DCT:

5. Program `D18F2x94_dct[1:0][MemClkFreqVal]` = 1. Wait for `D18F2x94_dct[1:0][FreqChgInProg]` = 0.

For each DCT:

6. Program `D18F2x9C_x0D0F_E006_dct[1:0][PllLockTime]` = 0Fh.

BIOS must observe the following requirements:

- BIOS must not change the PLL frequency after DRAM has exited from self-refresh.

- BIOS must not change the PLL frequency after the DRAM training for DDR3 DIMMs is complete.

### 2.10.5.3.2.1 Requirements for DRAM Frequency Change During Training

During DRAM training, BIOS may be required to change the DRAM(MEMCLK) frequency. The steps below describe what is required to prepare the processor and memory subsystem for the new MEMCLK frequency. It is assumed that the memory subsystem has previously been initialized at the current MEMCLK frequency, and this procedure describes only the steps that must be repeated at the new MEMCLK frequency. See [2.10.5.8.1 \[Write Levelization Training\]](#) and [2.10.5.8.2 \[DQS Receiver Enable Training\]](#).

1. Force the NB P-state. See [2.10.5.2](#).
2. Enter self-refresh:
  - A. Program `D18F2x90_dct[1:0][DisDllShutDownSR] = 1`.
  - B. Program `D18F2x90_dct[1:0][EnterSelfRef] = 1`.
  - C. Wait for `D18F2x90_dct[1:0][EnterSelfRef] = 0`.
3. DRAM channel frequency change. See [2.10.5.3.2](#).
4. Phy fence programming. See [2.10.5.3.3](#).
5. Phy compensation initialization. See [2.10.5.3.4](#).
6. Program SPD configuration. See [2.10.5.4](#).
7. Program Non-SPD configuration. See [2.10.5.5](#).
8. Exit self-refresh:
  - A. Program `D18F2x90_dct[1:0][ExitSelfRef] = 1`.
  - B. Wait for `D18F2x90_dct[1:0][ExitSelfRef] = 0`.
  - C. IF (`C32r1 || G34r1`) THEN Program `D18F2x90_dct[1:0][DisDllShutDownSR] = 0`. ENDIF.
9. Re-program devices with frequency dependent mode register field values. See [2.10.5.7](#).

### 2.10.5.3.3 Phy Fence Programming

The DDR phy fence logic is used to adjust the phase relationship between the data fifo and the data going to the pad. After any MEMCLK frequency change and before any memory training, BIOS must perform phy fence training for each channel using the following steps:

1. Program `D18F2x9C_x0000_0008_dct[1:0][FenceTrSel]=10b`.
2. Program `D18F2x9C_x0000_00[52:50]_dct[1:0]=1313_1313h`.
3. Perform phy fence training. See [2.10.5.3.3.1 \[Phy Fence Training\]](#).
4. Write the calculated fence value to `D18F2x9C_x0000_000C_dct[1:0][FenceThresholdTxDll]`.
5. Program `D18F2x9C_x0D0F_0[F,8:0]0F_dct[1:0][AlwaysEnDllClks]=001b`.
6. Program `D18F2x9C_x0000_0008_dct[1:0][FenceTrSel]=01b`.
7. Program `D18F2x9C_x0000_00[52:50]_dct[1:0]=1313_1313h`.
8. Perform phy fence training. See [2.10.5.3.3.1 \[Phy Fence Training\]](#).
9. Write the calculated fence value to `D18F2x9C_x0000_000C_dct[1:0][FenceThresholdRxDll]`.
10. Program `D18F2x9C_x0D0F_0[F,8:0]0F_dct[1:0][AlwaysEnDllClks]=000b`.
11. Program `D18F2x9C_x0000_0008_dct[1:0][FenceTrSel]=11b`.
12. Program `D18F2x9C_x0000_00[52:50]_dct[1:0]=1313_1313h`.
13. Perform phy fence training. See [2.10.5.3.3.1 \[Phy Fence Training\]](#).
14. Write the calculated fence value to `D18F2x9C_x0000_000C_dct[1:0][FenceThresholdTxPad]`.
15. IF (`D18F2x9C_x0000_000C_dct[1:0][FenceThresholdTxPad] < 16`) THEN
  - Program `D18F2x9C_x0D0F_[C,8,2][2:0]31_dct[1:0] = {001h,`
  - `D18F2x9C_x0000_000C_dct[1:0][19:16]}`
  - ELSE
  - Program `D18F2x9C_x0D0F_[C,8,2][2:0]31_dct[1:0] = 0000h`
  - ENDIF.

16. Program Fence2 threshold for data as follows:
- IF (D18F2x9C\_x0000\_000C\_dct[1:0][FenceThresholdTxPad] < 16) THEN  
 Fence2\_TxPad[4:0] = {1b, D18F2x9C\_x0000\_000C\_dct[1:0][19:16]}  
 ELSE  
 Fence2\_TxPad[4:0] = 00000b  
 ENDIF.
  - IF (D18F2x9C\_x0000\_000C\_dct[1:0][FenceThresholdRxDll] < 16) THEN  
 Fence2\_RxDll[4:0] = {1b, D18F2x9C\_x0000\_000C\_dct[1:0][24:21]}  
 ELSE  
 Fence2\_RxDll[4:0] = 00000b  
 ENDIF.
  - IF (D18F2x9C\_x0000\_000C\_dct[1:0][FenceThresholdTxDll] < 16) THEN  
 Fence2\_TxDll[4:0] = {1b, D18F2x9C\_x0000\_000C\_dct[1:0][29:26]}  
 ELSE  
 Fence2\_TxDll[4:0] = 00000b  
 ENDIF.
  - Program D18F2x9C\_x0D0F\_0[F,8:0]31\_dct[1:0] = {0b, Fence2\_RxDll[4:0], Fence2\_TxDll[4:0], Fence2\_TxPad[4:0]}.
17. If motherboard routing requires CS[7:6] to adopt address timings, BIOS performs the following:
- Program D18F2xA8\_dct[1:0][CSTimingMux67] = 1.
  - Program D18F2x9C\_x0D0F\_8021\_dct[1:0]:
    - DiffTimingEn = 1.
    - IF (D18F2x9C\_x0000\_0004\_dct[1:0][AddrCmdFineDelay] >= D18F2x9C\_x0D0F\_E008\_dct[1:0][FenceValue]) THEN Fence = 1 ELSE Fence = 0.
    - Delay = D18F2x9C\_x0000\_0004\_dct[1:0][AddrCmdFineDelay].
18. Reprogram D18F2x9C\_x0000\_0004\_dct[1:0].

When resuming from S3, it is recommended that BIOS reprogram D18F2x9C\_x0000\_000C\_dct[1:0][Fence-ThresholdTxDll, FenceThresholdRxDll, FenceThresholdTxPad], D18F2x9C\_x0D0F\_[C,8,2][2:0]31\_dct[1:0], D18F2x9C\_x0D0F\_0[F,8:0]31\_dct[1:0], and D18F2x9C\_x0D0F\_8021\_dct[1:0] from values stored in from non-volatile storage instead of training.

#### 2.10.5.3.3.1 Phy Fence Training

- Program D18F2x9C\_x0000\_0008\_dct[1:0][PhyFenceTrEn]=1.
- Wait 2000 MEMCLKs.
- Program D18F2x9C\_x0000\_0008\_dct[1:0][PhyFenceTrEn]=0.
- Read the phase recovery engine registers D18F2x9C\_x0000\_00[52:50]\_dct[1:0].
- Calculate the average of the fine delay values of all byte lanes and subtract 6. If the result is negative then the fence value is zero.

#### 2.10.5.3.4 Phy Compensation Initialization

Each DDR IO driver has a programmable slew rate controlled by the pre-driver calibration code. The recommended slew rate is a function of the DC drive strength. BIOS initializes the recommended nominal slew rate values as follows:

- Program D18F2x9C\_x0D0F\_E003\_dct[1:0][DisAutoComp, DisablePredriverCal]= {1b, 1b}.
- Program TxPreP/TxPreN for Data and DQS according to Table 38, Table 39, and Table 40.

- A. Program `D18F2x9C_x0D0F_0[F,8:0]0[A,6]_dct[1:0]`={0000b, TxPreP, TxPreN}.
- B. Program `D18F2x9C_x0D0F_0[F,8:0]02_dct[1:0]`={1000b, TxPreP, TxPreN}.
- 3. Program TxPreP/TxPreN for Cmd/Addr according to Table 47, Table 48, and Table 49.
  - A. Program `D18F2x9C_x0D0F_[C,8][1:0][12,0E,0A,06]_dct[1:0]`={0000b, TxPreP, TxPreN}.
  - B. Program `D18F2x9C_x0D0F_[C,8][1:0]02_dct[1:0]`={1000b, TxPreP, TxPreN}.
- 4. Program TxPreP/TxPreN for Clock according to Table 50, Table 51, and Table 52.
  - A. Program `D18F2x9C_x0D0F_2[2:0]02_dct[1:0]`={1000b, TxPreP, TxPreN}.

#### 2.10.5.4 SPD ROM-Based Configuration

The Serial Presence Detect (SPD) ROM is a non-volatile memory device on the DIMM encoded by the DIMM manufacturer. The description of the SPD is usually provided on a data sheet for the DIMM itself along with data describing the memory devices used. The data describes configuration and speed characteristics of the DIMM and the SDRAM components mounted on the DIMM. The associated data sheet also contains the DIMM byte values that are encoded in the SPD on the DIMM.

BIOS reads the values encoded in the SPD ROM through a system-specific interface. BIOS acquires DIMM configuration information, such as the amount of memory on each DIMM, from the SPD ROM on each DIMM and uses this information to program the DRAM controller registers.

The SPD ROM provides values for several DRAM timing parameters that are required by the DCT. In general, BIOS should use the optimal value specified by the SPD ROM. These parameters are:

- [D18F2x8C\\_dct\[1:0\]\[Tref\]](#)
- [D18F2x200\\_dct\[1:0\]\[Tras\]](#): Active to precharge time
- [D18F2x200\\_dct\[1:0\]\[Trp\]](#): Precharge time
- [D18F2x200\\_dct\[1:0\]\[Trcd\]](#): RAS to CAS delay
- [D18F2x200\\_dct\[1:0\]\[Tcl\]](#): CAS latency
- [D18F2x204\\_dct\[1:0\]\[Trtp\]](#): Internal read to precharge command delay time
- [D18F2x204\\_dct\[1:0\]\[FourActWindow\]](#): Four activate window delay time
- [D18F2x204\\_dct\[1:0\]\[Trrd\]](#): Row active to row active delay
- [D18F2x204\\_dct\[1:0\]\[Trc\]](#): Active to active/refresh time
- [D18F2x208\\_dct\[1:0\]\[Trfc3, Trfc2, Trfc1, Trfc0\]](#): Refresh recovery delay time
- [D18F2x20C\\_dct\[1:0\]\[Twtr\]](#): Internal write to read command delay time
- [D18F2x22C\\_dct\[1:0\]\[Twr\]](#): Write recovery time

Optimal cycle time is specified for each DIMM and is used to limit or determine bus frequency.

Additionally, the SPD ROM provides values for several DIMM parameters that must be programmed by MRS or RCW commands. See [2.10.5.7 \[DRAM Device and Controller Initialization\]](#). These parameters are:

- RDIMM
  - [RC3, RC4, RC5](#)
- LRDIMM
  - [F0RC2, F0RC3, F0RC4, F0RC5](#)
  - [F1RC8, F1RC11, F1RC12, F1RC13, F1RC14, F1RC15](#)
  - [F3RC8, F3RC9](#)
  - [F\[10:3\]RC10, F\[10:3\]RC11](#)
  - [F\[15:14\]RC\[15:8,6:0\]](#)
  - [MR1\\_dct\[1:0\], MR2\\_dct\[1:0\]](#)

#### 2.10.5.4.1 LRDIMM Module Delay Time SPD Bytes

The SPD ROM provides values for the module delay. BIOS uses this information to configure [D18F2x240\\_dct\[1:0\]\[RdOdtTrnOnDly, RdOdtOnDuration\]](#) as follows:

- $\text{BufDatDelay} = \text{FLOOR}(\frac{((\text{SmallestModuleDelay} - \text{SynchDelay}) * (\text{MemClkFreq} / 400 \text{ MHz})) + \text{SynchDelay}}{0x40})$ .
  - $\text{SmallestModuleDelay} = \text{MinimumModuleDelay} * .000125 \text{ us} * 400 \text{ MHz} * 0x40$ .
    - [MinimumModuleDelay](#) is the minimum SPD module delay across all DIMMs on a channel.
  - $\text{SynchDelay} = (\text{F0RC2}[\text{AddrCmdPrelaunch}] ? 0x30 - (2 * \text{F1RC12}[\text{QCAPrelaunchDelay}]) : 0x20) + 0x10$ .
    - SyncDelay is calculated from the SPD values of the [MinimumModuleDelay](#) DIMM.
- Program [D18F2x240\\_dct\[1:0\]\[RdOdtTrnOnDly\]](#) =  $\text{MAX}(0, \text{D18F2x200\_dct[1:0][Tcl]} - \text{D18F2x20C\_dct[1:0][Tcwl]}) + \text{BufDatDelay}$ .
- $\text{BufDatDelaySkew} = \text{ROUND}(\frac{((\text{LargestModuleDelay} - \text{SynchDelay}) * \text{MemClkFreq} / 400 \text{ MHz}) + \text{SynchDelay} - (\text{BufDatDelay} * 0x40)}{0x40})$ .
  - $\text{LargestModuleDelay} = \text{MaximumModuleDelay} * .000125 \text{ us} * 400 \text{ MHz} * 0x40$ .
    - [MaximumModuleDelay](#) is the maximum SPD module delay across all DIMMs on a channel.
  - $\text{SynchDelay} = (\text{F0RC2}[\text{AddrCmdPrelaunch}] ? 0x30 - (2 * \text{F1RC12}[\text{QCAPrelaunchDelay}]) : 0x20) + 0x10$ .
    - SyncDelay is calculated from the SPD values of the [MaximumModuleDelay](#) DIMM.
- Program [D18F2x240\\_dct\[1:0\]\[RdOdtOnDuration\]](#) =  $6 + \text{BufDatDelaySkew}$ .

#### 2.10.5.5 Non-SPD ROM-Based Configuration

There are several DRAM timing parameters and DCT configurations that need to be programmed for optimal memory performance. These values are not derived from the SPD ROM. Several of these timing parameters are functions of other configuration values. These interdependencies must be considered when programming values into several DCT register timing fields. The factors to consider when specifying a value for a specific non-SPD timing parameter are:

- Mixed or non-mixed DIMMs (x4 with x8).
- Training delay values. See [2.10.5.8 \[DRAM Training\]](#).
- Read and write latency differences.
- The phy's idle clock requirements on the data bus.
- DDR3 ODT timing requirements.

- NCLK frequency
- MEMCLK frequency

The following sub-sections describe how BIOS programs each non-SPD related timing field to a recommended minimum timing value with respect to the above factors.

The following terms are defined to simplify calculations and are calculated in MEMCLKs:

- Latency Difference (LD) =  $D18F2x200\_dct[1:0][Tcl] - D18F2x20C\_dct[1:0][Tcwl]$ .
- Read ODT Delay (ROD) =  $\text{MAX}(0, D18F2x240\_dct[1:0][RdOdtOnDuration] - 6)$ .
- Write ODT Delay (WOD) =  $\text{MAX}(0, D18F2x240\_dct[1:0][WrOdtOnDuration] - 6)$ .
- $WrEarly = \text{ABS}(D18F2xA8\_dct[1:0][WrDqDqsEarly]) / 2$ .
- $BufDatDelay = \text{IF LRDIMM See 2.10.5.4.1 [LRDIMM Module Delay Time SPD Bytes] ELSE } 0 \text{ ENDIF}$ .

#### 2.10.5.5.1 TrdrdSdSc, TrdrdSdDc, and TrdrdDd (Read to Read Timing)

The optimal values for  $D18F2x218\_dct[1:0][TrdrdSdSc, TrdrdSdDc, TrdrdDd]$  are platform and configuration specific and should be characterized for best performance. Prior to DRAM training, BIOS should program these parameters to the largest defined value. After DRAM training, BIOS should use the guidelines below to configure the recommended platform generic timing values:

- $TrdrdSdSc$  (in MEMCLKs) = 1.
- $TrdrdSdDc$  (in MEMCLKs) =  $\text{MAX}(TrdrdSdSc, 3 + (\text{IF } D18F2x94\_dct[1:0][FourRankRDimm1] | D18F2x94\_dct[1:0][FourRankRDimm0]) \text{ THEN } (\text{CEIL}(CDD_{TrdrdSdDc} / 2) + 0.5) \text{ ELSE } 0 \text{ ENDIF}))$ .
- $TrdrdDd$  (in MEMCLKs) =  $\text{MAX}(TrdrdSdDc, \text{CEIL}(\text{MAX}(\text{ROD} + 3, CDD_{TrdrdDd} / 2 + 3.5)))$ .

The Critical Delay Difference (CDD) is the largest delay difference of the channel.

- Each delay difference is  $D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay]$  minus  $D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay]$ .
- For  $CDD_{TrdrdSdDc}$ , the subtraction terms are the delays of different chip selects within the same DIMM within the same byte lane.
- For  $CDD_{TrdrdDd}$ , the subtraction terms are the delays of different DIMMs within the same byte lane.

#### 2.10.5.5.2 TwrwrSdSc, TwrwrSdDc, TwrwrDd (Write to Write Timing)

The optimal values for  $D18F2x214\_dct[1:0][TwrwrSdSc, TwrwrSdDc, TwrwrDd]$  are platform and configuration specific and should be characterized for best performance. Prior to DRAM training, BIOS should program these parameters to the largest defined value. After DRAM training, BIOS should use the guidelines below to configure the recommended platform generic timing values:

- $TwrwrSdSc$  (in MEMCLKs) = 1.
- $TwrwrSdDc$  (in MEMCLKs) =  $\text{MAX}(TwrwrSdSc, \text{CEIL}(\text{MAX}(\text{WOD} + 3, CDD_{TwrwrSdDc} / 2 + (\text{IF } D18F2x94\_dct[1:0][FourRankRDimm1] | D18F2x94\_dct[1:0][FourRankRDimm0]) \text{ THEN } 3.5 \text{ ELSE } 3 \text{ ENDIF})))$ .
- $TwrwrDd$  (in MEMCLKs) =  $\text{MAX}(TwrwrSdDc, \text{CEIL}(\text{MAX}(\text{WOD} + 3, CDD_{TwrwrDd} / 2 + 3.5)))$ .

The Critical Delay Difference (CDD) is the largest delay difference of the channel.

- Each delay difference is  $D18F2x9C\_x0000\_00[4A:30]\_dct[1:0][WrDqsGrossDly]$  minus  $D18F2x9C\_x0000\_00[4A:30]\_dct[1:0][WrDqsGrossDly]$ .
- For  $CDD_{TwrwrSdDc}$ , the subtraction terms are the delays of different chip selects within the same DIMM within the same byte lane.

- For  $CDD_{TwrwrDd}$ , the subtraction terms are the delays of different DIMMs within the same byte lane.

### 2.10.5.5.3 Twrrd (Write to Read DIMM Termination Turn-around)

The optimal value for  $D18F2x218\_dct[1:0][Twrrd]$  is platform and configuration specific and should be characterized for best performance. Prior to DRAM training, BIOS should program these parameters to the largest defined value. After DRAM training, BIOS should use the guidelines below to configure the recommended platform generic timing values:

- IF (LRDIMM) THEN  
 $Twrrd \text{ (in MEMCLKs)} = \text{MAX}(1, \text{CEIL}(\text{MAX}(\text{WOD} - \text{BufDatDelay}, CDD_{Twrrd} / 2 + 0.5 - \text{WrEarly}, (\text{DdrRate} \geq 1866 ? 1 : 0)) - \text{LD} + 3))$   
 ELSE  
 $Twrrd \text{ (in MEMCLKs)} = \text{MAX}(1, \text{CEIL}(\text{MAX}(\text{WOD}, CDD_{Twrrd} / 2 + 0.5 - \text{WrEarly}) - \text{LD} + 3))$   
 ENDIF.

The Critical Delay Difference (CDD) is the largest delay difference of the channel.

- Each delay difference is  $D18F2x9C\_x0000\_00[4A:30]\_dct[1:0][WrDqsGrossDly]$  minus  $D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay]$ .
- For  $CDD_{Twrrd}$ , the subtraction terms are the delays of different chip selects within the same byte lane.

### 2.10.5.5.4 TrwtTO (Read-to-Write Turnaround for Data, DQS Contention)

The optimal value for  $D18F2x21C\_dct[1:0][TrwtTO]$  is platform and configuration specific and should be characterized for best performance. Prior to DRAM training, BIOS should program this parameter to the largest defined value. After DRAM training, BIOS should use the guidelines below to configure the recommended platform generic timing values after DDR training is complete:

- $TrwtTO \text{ (in MEMCLKs)} = \text{CEIL}(\text{MAX}(\text{ROD} + \text{BufDatDelay}, CDD_{TrwtTO} / 2 - 0.5 + \text{WrEarly}) + \text{LD} + 3)$ .
- If 1 DIMM/ch, substitute  $\text{ROD} = 0$  and  $\text{BufDatDelay} = 0$  in the above equation.

The Critical Delay Difference (CDD) is the largest delay difference of the channel.

- Each delay difference is  $D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay]$  minus  $D18F2x9C\_x0000\_00[4A:30]\_dct[1:0][WrDqsGrossDly]$ .
- For  $CDD_{TrwtTO}$ , the subtraction terms are the delays of all chip selects within the same byte lane.

### 2.10.5.5.5 DRAM ODT Control

This section describes the ODT configurations and settings for the attached DIMMs. The tables specify ODT values for different speeds and configurations on a per channel basis. For UDIMMs and RDIMMs, the DIMM termination values are programmed to values as specified below via MRS commands. For LRDIMMs, the host-to-buffer termination values are programmed via RCW commands. See the SPD for the buffer-to-DRAM values and patterns to program via MRS commands. See [2.10.5.7 \[DRAM Device and Controller Initialization\]](#).

These tables document the optimal settings for motherboards which meet the relevant motherboard design guidelines. See [2.10 \[DRAM Controllers \(DCTs\)\]](#) for an overview of the DIMM population and memory bus speed support.

Table 53: BIOS Recommendations for RttNom and RttWr (G34r1 &amp; UDIMM)

| Condition    |                |                 |       |        |       |      |      | MR1<br>_dct[<br>_1:0] | MR2<br>_dct[<br>_1:0] |

BIOS configures the DIMM ODT behavior per chip select according to the DIMM population. The ODT patterns for reads and writes are programmed using [D18F2x\[234:230\]\\_dct\[1:0\]](#) and [D18F2x\[23C:238\]\\_dct\[1:0\]](#), respectively, per the recommended values specified by the following tables. In all cases, the processor ODT is off for writes and is on for reads.

BIOS also configures the DIMM ODT pattern used during write leveling by setting [D18F2x9C\\_x0000\\_0008\\_dct\[1:0\]\[WrLvOdtEn\]](#) and programming [D18F2x9C\\_x0000\\_0008\\_dct\[1:0\]\[WrLvOdt\]](#). BIOS programs [D18F2x9C\\_x0000\\_0008\\_dct\[1:0\]\[WrLvOdt\]](#) with the [D18F2x\[23C:238\]\\_dct\[1:0\]](#) value provided for writes to the rank targeted by training. See 2.10.5.8.1 [Write Levelization Training].

See 2.10.2 [DDR Pad to Processor Pin Mapping] when programming [D18F2x\[234:230\]\\_dct\[1:0\]](#), [D18F2x\[23C:238\]\\_dct\[1:0\]](#), and [D18F2x9C\\_x0000\\_0008\\_dct\[1:0\]\[WrLvOdt\]](#).

#### 2.10.5.5.6 DRAM Address Timing and Output Driver Compensation Control

This section describes the settings required for programming the timing on the address pins, the CS/ODT pins, and the CKE pins. The following tables document the address timing and output driver settings on a per channel basis for DDR3 DIMM types. These tables document the optimal settings for motherboards which meet the relevant motherboard design guidelines. See [2.10 \[DRAM Controllers \(DCTs\)\]](#) for an overview of the DIMM population and memory bus speed support.

### 2.10.5.6 DCT Training Specific Configuration

The DCT requires certain features be disabled during DRAM device initialization and training. BIOS should program the registers in Table 76 before DRAM device initialization and training. For normal operation, BIOS programs the recommended values if provided in Table 76. BIOS must quiesce all other forms of DRAM traffic on the channel being trained. See 2.10.5 [DCT/DRAM Initialization and Resume].

**Table 76: DCT Training Specific Register Values**

| Register  | Training | Normal Operation                                   |
|---|----------|--|
| D18F2x78_dct[1:0][AddrCmdTriEn]   | 0        | 1  |

### 2.10.5.7 DRAM Device and Controller Initialization

BIOS initializes the DRAM devices and the controller using a software controlled sequence. See 2.10.5.7.1 [Software DDR3 Device Initialization].

BIOS must observe additional requirements for changing the PLL frequency when setting D18F2x7C\_dct[1:0][EnDramInit]. See 2.10.5.3.2 [DRAM Channel Frequency Change].

DRAM initialization is complete after the value of D18F2x7C\_dct[1:0][EnDramInit] is written by BIOS from 1 to 0 in the software-controlled sequence.

#### 2.10.5.7.1 Software DDR3 Device Initialization

BIOS should apply the following procedure to each DCT to initialize the DDR3 DIMMs on the channel. This procedure should be run only when booting from an unpowered state (ACPI S4, S5 or G3; not S3, suspend to RAM).

1. Program D18F2x7C\_dct[1:0][EnDramInit] = 1.
2. Wait 200 us.
3. Program D18F2x7C\_dct[1:0][DeassertMemRstX] = 1.
4. Wait 500 us.
5. Program D18F2x7C\_dct[1:0][AssertCke] = 1.

6. Wait 360 ns.

The following step is performed with registered DIMMs or LRDIMMs:

7. Program `D18F2x90_dct[1:0][ParEn] = ~D18F2x90_dct[1:0][UnbuffDimm]`.

The following steps are performed with registered DIMMs only and must be performed for each chip select pair:

8. Send RC0, RC1, and RC2.
9. Wait 6 us.
10. Send RC3, RC4, and RC5.
11. Send RC6 and RC7 for custom settings at this time, as directed by the DIMM manufacturer's data sheet.
12. Send the remaining RCW. See [2.10.5.7.1.2](#).

The following steps are performed with LRDIMMs only and must be performed for each DIMM:

13. Send F0RC0, F0RC1, F0RC2, F0RC10, F0RC11, F1RC8, and F1RC11 - F1RC15.
14. Wait 6 us.
15. Send F0RC3, F0RC4, and F0RC5.
16. Send the remaining RCWs. See [2.10.5.7.1.2](#).
17. Send the extended RCWs. See [2.10.5.7.1.2.3](#)

The following steps are performed once for each channel with unbuffered DIMMs, once for each chip select with registered DIMMs, and once for each physical rank with LRDIMMs:

18. Send MRS(2).
19. Send MRS(3). Ordinarily at this time, `MrsAddress[2:0] = 000b`.
20. Send MRS(1) with `MrsAddress[7] = 0`.
21. Send MRS(0) with `MrsAddress[8] = 1`.

The following steps are performed for all DIMM types:

22. Send two ZQCL commands.
  - BIOS instructs the DCT to send a ZQCL command by programming `D18F2x7C_dct[1:0]` as follows:
    - Program `MrsAddress[10] = 1`.
    - Program `SendZQCmd = 1`.
    - Wait for `SendZQCmd = 0`.
    - Wait 512 MEMCLKs.
23. Program `D18F2x7C_dct[1:0][EnDramInit] = 0`.

The following steps are performed with LRDIMMs only and must be performed for each DIMM:

24. Configure the DCT and LRDIMM:
  - Program `D18F2xA8_dct[1:0][LrDimmErrOutMonEn]=1`.
  - Send `F2RC3` with data = 1000b.
25. Send `F0RC12` with data = 0010b.
26. Wait until `D18F2xA0_dct[1:0][RcvParErr]=0` or the JEDEC specified training time expires.
27. Configure for normal operation:
  - Program `D18F2xA8_dct[1:0][LrDimmErrOutMonEn]=0`.
  - Send `F2RC3` with data = 0000b.
  - Send `F0RC12` with data = 0000b.

#### 2.10.5.7.1.1 DDR3 MR Initialization

BIOS instructs the DCT to send MRS commands by programming `D18F2x7C_dct[1:0]` as follows:

1. Program MrsBank and MrsAddress as specified below:
  - MrsBank[2:0] = BA2:BA0 to address MR[3:0].
  - MrsAddress[15:0] = A15:A0 to write data[15:0].
  - BIOS may need to remap bits, see also [D18F2x\[5C:40\]\\_dct\[1:0\]\[OnDimmMirror\]](#).
  - Set all other bits in MrsAddress to zero. BIOS should write reserved fields as 0.
2. Program MrsChipSel as appropriate.
3. Program SendMrsCmd = 1.
4. Wait for SendMrsCmd = 0.

For LRDIMMs, the behavior of MRS commands issued to physical ranks associated with the logical rank selected by [D18F2x7C\\_dct\[1:0\]\[MrsChipSel\]](#) depends on the setting of [F0RC14\[MRSCCommandControl\]](#):

- MRSCCommandControl=0
  - The MRS command is issued to each physical rank of the LRDIMM associated with the logical rank.
- MRSCCommandControl=1
  - If MrsAddress[13] = 1
    - The MRS command is issued to each physical rank of the LRDIMM associated with the logical rank.
  - Else
    - The MRS command issued to a specific physical rank based on [D18F2x7C\\_dct\[1:0\]\[MrsAddress\[17:14\]\]](#). See [2.10.11.1 \[LRDIMM Rank Multiplication\]](#).

#### 2.10.5.7.1.2 Software Control Word Initialization

DDR3 register devices on RDIMMs contain up to 16 control words, referred to as RC0 to RC15. LRDIMM buffer devices contain up to 16 functions, each containing up to 16 control words. Each control word is four bits. These devices are programmed at the bus using an RCW command by (a) presenting the 4-bit address of the control word on [BA2, A2, A1, A0], (b) presenting the 4-bit write data on [BA1, BA0, A4, A3], and (c) asserting both chip selects of a chip select pair. For LRDIMMs, RC7 serves as the function select control word.

A RCW(n) command for DDR3 register device initialization is accomplished by programming [D18F2x7C\\_dct\[1:0\]](#) and [D18F2xA8\\_dct\[1:0\]\[CtrlWordCS\]](#) as follows:

1. Program MrsBank and MrsAddress.

- $n = [BA2, A2, A1, A0]$ .
  - $data = [BA1, BA0, A4, A3]$ .
  - Set all other bits in *MrsAddress* to zero. BIOS should write reserved fields as 0.
2. Program [D18F2xA8\\_dct\[1:0\]](#)[CtrlWordCS]=bit mask for the target chip selects.
  3. Set *SendControlWord* = 1.
  4. Wait for *SendControlWord* = 0.

For RDIMMs with [NumRegisters](#)=2, BIOS must initialize the register control words of both devices on the DIMM by programming each chip select pair.

BIOS must wait 6 us after programming [RC2](#), [RC10](#), [F0RC2](#), [F0RC10](#), [F0RC11](#), [F1RC8](#), or [F1RC11-F1RC15](#).

#### 2.10.5.7.1.2.1 RDIMM Control Words

##### RC0 DDR3 Register Control Word 0

| Bits | Description  |
|------|--|
| 3:2  | <b>OutputsDisabled:</b> outputs disabled. BIOS: 0. |
| 1    | <b>FloatingOutputs:</b> floating outputs. BIOS: 1. |
| 0    | <b>OutputInversion:</b> output inversion. BIOS: 0. |

##### RC1 DDR3 Register Control Word 1

| Bits | Description  |
|------|--|
| 3:0  | <b>DisableOutputClock:</b> disable output clock. BIOS: IF ( <a href="#">DIMM</a> == <a href="#">SR</a> ) THEN Ch ELSE 0 ENDIF. |

| Bits | Description   |
|------|---|
| 3    | <b>FrequencyBandSelect:</b> frequency band select. BIOS: 0.   |
| 2    | <b>IBT[0]: input bus termination.</b> IBT[3:0] = {RC8[IBT[3:1]], IBT[0]}. BIOS: <a href="#">Table 80</a> , <a href="#">Table 81</a> . BIOS settings of this field are for motherboards which meet the relevant motherboard design guidelines. |
| 1    | <b>OutputTiming:</b> output timing. BIOS: 0.  |
| 0    | <b>AddrCmdPrelaunch:</b> address and command prelaunch. BIOS: 0.  |

**RC3 DDR3 Register Control Word 3**

| Bits | Description  |
|------|--|
| 3:0  | <b>CommandAddressDriverOutputs:</b> command and address driver outputs. BIOS: See <a href="#">2.10.5.4</a> . |

**RC4 DDR3 Register Control Word 4**

| Bits | Description   |
|------|---|
| 3:0  | <b>ControlDriverOutputs:</b> control driver outputs. BIOS: See <a href="#">2.10.5.4</a> . |

**RC5 DDR3 Register Control Word 5**

| Bits | Description   |
|------|---|
| 3:0  | <b>ClockOutputDrivers:</b> clock output drivers. BIOS: See <a href="#">2.10.5.4</a> . |

**RC[7:6] DDR3 Register Control Word [7:6]**

| Bits | Description |
|------|-------------|
| 3:0  | Reserved.   |

**RC8 DDR3 Register Control Word 8**

| Bits | Description  |
|------|--|
| 3    | <b>MirrorMode:</b> mirror mode. BIOS: 0.   |
| 2:0  | <b>IBT[3:1]:</b> input bus termination [3:1]. See: <a href="#">RC2[IBT[0]]</a> . |

**RC9 DDR3 Register Control Word 9**

| Bits | Description  |
|------|--|
| 3    | <b>CKEPowerDownModeEnable:</b> CKE power down mode enable. BIOS: 1.  |
| 2    | <b>CKEPowerDownMode:</b> CKE power down mode. BIOS: IF (mixed SR and (DR or QR) DIMMs on the channel and this DIMM is SR) THEN 0 ELSE 1 ENDIF. |
| 1    | Reserved.  |
| 0    | <b>WeakDriveMode:</b> weak drive mode. BIOS: 1.  |

**RC10 DDR3 Register Control Word 10**Table 82: [BIOS Recommendations](#) for [RC10\[OperatingSpeed\]](#)

| Condition               | <a href="#">RC10</a>           |
|-------------------------|--------------------------------|
| <a href="#">DdrRate</a> | <a href="#">OperatingSpeed</a> |

| 3:0  | Reserved.   |

## 2.10.5.7.1.2.2 LRDIMM Control Words

### F0RC0 DDR3 Buffer Function 0 Control Word 0

| Bits | Description   |
|------|---|
| 3:2  | <b>QVrefOutput:</b> QVref output. BIOS: 0.          |
| 1    | <b>OutputWeakDrive:</b> output weak drive. BIOS: 0. |
| 0    | <b>OutputInversion:</b> output inversion. BIOS: 0.  |

### F0RC1 DDR3 Buffer Function 0 Control Word 1

| Bits | Description   |
|------|---|
| 3:0  | <b>DisableOutputClock:</b> disable output clock. BIOS: 0. |

### F0RC2 DDR3 Buffer Function 0 Control Word 2

| Bits | Description  |
|------|--|
| 3    | <b>FrequencyBandSelect:</b> frequency band select. BIOS: 0.                                  |
| 2    | Reserved.  |
| 1    | <b>RankSwap:</b> rank swap. BIOS: See <a href="#">2.10.5.4</a> .                             |
| 0    | <b>AddrCmdPrelaunch:</b> address and command prelaunch. BIOS: See <a href="#">2.10.5.4</a> . |

### F0RC3 DDR3 Buffer Function 0 Control Word 3

| Bits | Description  |
|------|--|
| 3:2  | <b>CSDriverOutputs:</b> CS driver outputs. BIOS: See <a href="#">2.10.5.4</a> .                              |
| 1:0  | <b>CommandAddressDriverOutputs:</b> command and address driver outputs. BIOS: See <a href="#">2.10.5.4</a> . |

**F0RC4 DDR3 Buffer Function 0 Control Word 4**

| Bits | Description  |
|------|--|
| 3:2  | <b>CKEDriverOutputs:</b> CKE driver outputs. BIOS: See 2.10.5.4. |
| 1:0  | <b>ODTDriverOutputs:</b> ODT driver outputs. BIOS: See 2.10.5.4. |

**F0RC5 DDR3 Buffer Function 0 Control Word 5**

| Bits | Description  |
|------|--|
| 3:0  | <b>ClockOutputDrivers:</b> clock output drivers. BIOS: See 2.10.5.4. |

**F0RC6 DDR3 Buffer Function 0 Control Word 6**

| Bits | Description                               |
|------|---|
| 3    | Reserved.                                 |
| 2    | <b>ODTControl:</b> ODT control. BIOS: 0.  |
| 1:0  | <b>CKEControl:</b> CKE control. BIOS: 0h. |

**F[15:0]RC7 DDR3 Buffer Function [15:0] Control Word 7**

| Bits | Description  |

**2.10.5.7.1.2.3 LRDIMM Extended Control Words**

LRDIMM buffer devices contain an extended control word register space. Each control word is eight bits. These registers are programmed by using a series of RCW commands as follows:

1. Write **F13RC10** = addr[3:0].
2. Write **F13RC11** = addr[7:4].
3. Write **F13RC14** = data[3:0].
4. Write **F13RC15** = data[7:4].

**2.10.5.8 DRAM Training**

This section describes detailed methods used to train the processor DDR interface to DRAM for optimal functionality and performance. DRAM training is performed by BIOS after initializing the DRAM controller. See [2.10.5.7 \[DRAM Device and Controller Initialization\]](#).

Some of the DRAM training steps described in this section require two passes if the target MEMCLK frequency is greater than the lowest supported MEMCLK frequency. For optimal software performance, software may defer the second pass (at target MEMCLK frequency) for each training step until after the first pass (at lowest supported frequency) of all other training steps are complete. See [D18F2x94\\_dct\[1:0\]\[MemClkFreq\]](#).

See [2.10.5.6 \[DCT Training Specific Configuration\]](#) for additional training requirements.

In the following subsections, lane is used to describe an 8-bit wide data group, each with its own timing control.

### 2.10.5.8.1 Write Levelization Training

Write levelization involves using the phy to detect the edge of DQS with respect to the memory clock on the DIMM for write accesses to each lane.

Training is accomplished on a per channel, per DIMM basis. If the target frequency is greater than the lowest supported MEMCLK frequency then BIOS performs multiple passes; otherwise, only one pass is required. See [2.10.5.3.2.1 \[Requirements for DRAM Frequency Change During Training\]](#).

- Pass 1: Configure the memory subsystem for the lowest supported MEMCLK frequency.
- Pass 2 - Pass N: Configure the memory subsystem for the next higher supported MEMCLK frequency. Repeat until the target MEMCLK frequency is reached.

The following describes the steps used for each pass of write levelization training for each channel:

For each DIMM:

1. For UDIMMs or RDIMMs, prepare the DIMMs for write levelization using DDR3-defined MR commands. For LRDIMMs, prepare the DIMMs via RCW commands. See [2.10.5.7.1.1 \[DDR3 MR Initialization\]](#) and [2.10.5.7.1.2 \[Software Control Word Initialization\]](#).
  - In the following steps, a quad rank RDIMM is treated as two DIMMs. The target rank and next subsequent rank of a quad rank DIMM are referred to as the target DIMM. The remaining two ranks are treated as a non-target DIMM. A quad logical rank LRDIMM is trained once, but both sets of delay registers must be programmed.
- A. Prepare the target DIMM for write leveling:
  - For UDIMMs and RDIMMs, configure the output driver and on-die termination of the target DIMM as follows:
    - For the first rank of the target DIMM, program `MR1_dct[1:0][Level]=1` and `MR1_dct[1:0][Qoff] = 0`.
    - For all other ranks of the target DIMM, program `MR1_dct[1:0][Level]=1` and `MR1_dct[1:0][Qoff] = 1`.
    - For two or more DIMMs per channel or one of three DIMMs per channel, program RttNom of the target rank to the corresponding specified RttWr termination. Otherwise, configure RttNom of the target DIMM as normal. See [2.10.5.5.5 \[DRAM ODT Control\]](#).
  - For LRDIMMs, configure write leveling mode and the on-die termination of the target DIMM as follows:
    - Program `F0RC12 = 1h`.
    - For two or more LRDIMMs per channel, program the buffer RttNom to the corresponding specified RttWr termination. Otherwise, configure the buffer RttNom as normal. See [2.10.5.5.5 \[DRAM ODT Control\]](#).
- B. Configure RttNom on the non-target DIMMs as normal. See [2.10.5.5.5 \[DRAM ODT Control\]](#).
2. Wait 40 MEMCLKs.
3. Configure the phy for write levelization training:
  - A. Program `D18F2x9C_x0000_0008_dct[1:0][WrtLvTrEn]=0`.
  - B. Program `D18F2x9C_x0000_0008_dct[1:0][TrDimmSel]` to specify the target DIMM to be trained.
  - Program `D18F2x9C_x0000_0008_dct[1:0][TrNibbleSel]=0`.
    - For x4 DIMMs, BIOS trains both nibbles of a byte lane by programming `D18F2x9C_x0000_0008_dct[1:0][TrNibbleSel]` to specify the nibble. BIOS repeats steps 3 through 5 and uses the average of the trained values for the delay setting.
  - C. Program `D18F2x9C_x0000_0008_dct[1:0][WrLvOdt]` to the proper ODT settings for the current memory subsystem configuration. See [2.10.5.5.5 \[DRAM ODT Control\]](#).
  - D. Program `D18F2x9C_x0000_0008_dct[1:0][WrLvOdtEn]=1`.
  - E. MFENCE.

- F. Wait 10 MEMCLKs to allow for ODT signal settling.
- G. For each lane program an initial value to registers `D18F2x9C_x0000_00[52:50]_dct[1:0]` to set the gross and fine delay. See 2.10.5.8.1.1 [Write Leveling Seed Value].
4. Perform write leveling of the devices on the DIMM:
  - A. Program `D18F2x9C_x0000_0008_dct[1:0][WrtLvTrEn]=1`.
  - B. MFENCE.
  - C. Wait 200 MEMCLKs.
  - D. Program `D18F2x9C_x0000_0008_dct[1:0][WrtLvTrEn]=0`.
  - E. Read from registers `D18F2x9C_x0000_00[52:50]_dct[1:0]` to get the gross and fine delay settings for the target DIMM and save these values.
5. Disable write levelization training so that the phy stops driving write levelization ODT.
  - A. Program `D18F2x9C_x0000_0008_dct[1:0][WrLvOdtEn]=0`.
  - B. MFENCE.
  - C. Wait 10 MEMCLKs to allow for ODT signal settling.
6. Program the target DIMM back to normal operation by configuring the following:
  - If LRDIMM then
    - Program `F0RC12 = 0`.
  - Else
    - Configure all ranks of the target DIMM for normal operation setting `MR1_dct[1:0][Qoff, Level]={0b, 0b}`.
    - For a two or more DIMM system, program the `RttNom` value for the target DIMM to the normal operating termination.

For each DIMM:

- BIOS calculates and programs the final saved gross and fine delay values for each lane into `D18F2x9C_x0000_00[4A:30]_dct[1:0]` [DRAM DQS Write Timing].
  - `WrDqsFineDly = PhRecFineDly`.
  - `GrossDly = SeedGross + PhRecGrossDly - SeedPreGross`.
    - The Critical Gross Delay (CGD) is the minimum `GrossDly` of all byte lanes and all DIMMs.
    - If  $(CGD < 0)$  Then
      - `D18F2x9C_x0000_00[4A:30]_dct[1:0][WrDqDqsEarly] = ABS(CGD)`
      - `WrDqsGrossDly = GrossDly + WrDqDqsEarly`
    - Else
      - `D18F2x9C_x0000_00[4A:30]_dct[1:0][WrDqDqsEarly] = 0`.
      - `WrDqsGrossDly = GrossDly`.

#### 2.10.5.8.1.1 Write Leveling Seed Value

The seed value for pass 1 of write leveling is design and platform specific. The platform vendor may need to characterize and adjust this value for proper write levelization training. The seed delay value must fall within +/- 1.20 ns, including PVT and jitter, of the measured clock delay.

1. Calculate the total seed based on the following:
  - Pass 1:
    - `SeedTotal = The seed value found in Table 91-Table 93 + (RDIMM & RC2[AddrCmdPrelaunch] ? 0x10 : 0)`.
  - Pass 2 - Pass N:
    - If (RDIMM) then `RegisterDelay = (RC2[AddrCmdPrelaunch] ? 0x30 : 0x20)`.  
Else `RegisterDelay = 0`.
    - `SeedTotalPreScaling = (the total delay values D18F2x9C_x0000_00[4A:30]_dct[1:0] [DRAM DQS Write Timing] from the previous pass of write levelization training) - RegisterDelay - (0x20 * 0x10)`.

[D18F2xA8\\_dct\[1:0\]\[WrDqDqsEarly\]](#)).

- $\text{SeedTotal} = \text{RegisterDelay} + \text{FLOOR}(\text{SeedTotalPreScaling} * (\text{target frequency}) / (\text{frequency from previous pass}))$ .
2. If ( $\text{SeedTotal} \geq 0$ ) then  
 $\text{SeedGross} = \text{SeedTotal} \text{ DIV } 32$ .  
 $\text{SeedFine} = \text{SeedTotal} \text{ MOD } 32$ .  
 else  
 $\text{SeedGross} = (\text{SeedTotal} \text{ DIV } 32) - 1$ .  
 $\text{SeedFine} = (\text{SeedTotal} \text{ MOD } 32) + 32$ .  
 If ( $\text{SeedGross}$  is odd)  
 then  $\text{SeedPreGross} = 1$   
 else  $\text{SeedPreGross} = 2$ .
  3. Program [D18F2x9C\\_x0000\\_00\[52:50\]\\_dct\[1:0\]\[PhRecFineDly\]](#) =  $\text{SeedFine}$ .
  4. Program [D18F2x9C\\_x0000\\_00\[52:50\]\\_dct\[1:0\]\[PhRecGrossDly\]](#) =  $\text{SeedPreGross}$ .

### 2.10.5.8.2 DQS Receiver Enable Training

Receiver enable delay training is used to dynamically determine the optimal delay value for [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#) [[DRAM DQS Receiver Enable Timing](#)]. The optimal DQS receiver enable delay value is platform and load specific, and occurs in the middle of a received read preamble. The timing of the preamble includes the inbound DQS propagation delay, which is unknown by BIOS. The training for delay values involves:

1. Configuring the phy for an initial expected phase value (seed).
2. Generating a stream of read DQS edges from the DRAM by issuing multiple read commands.

3. The phy determining the phase between the received DQS edges and a reference clock.
4. Calculating a final delay value for enabling receivers during normal read operations using the phase determined by the phy.

BIOS should program `D18F2x210_dct[1:0]_nbp[3:0]` to 55h.

Training is accomplished on a per channel, per DIMM, per rank basis. If the target frequency is greater than the lowest frequency supported by both the controller and the DIMMs then BIOS performs two passes; otherwise only one pass is required. See [2.10.5.3.2 \[DRAM Channel Frequency Change\]](#).

- Pass 1: Configure the memory subsystem for the lowest supported MEMCLK frequency.
- Pass 2: Configure the memory subsystem for the target MEMCLK frequency.

The following describes the steps used for each pass of receiver enable training for each channel:

For each rank:

1. Program `D18F2x9C_x0000_0008_dct[1:0]` to specify the target DIMM to be trained.
  - Program `D18F2x9C_x0000_0008_dct[1:0]` to specify the target DIMM to be trained.
  - For x4 DIMMs, BIOS trains both nibbles of a byte lane by programming `D18F2x9C_x0000_0008_dct[1:0]` to specify the nibble. BIOS repeats steps 2 through 7 and uses the average of the trained values for the delay setting.
2. For each lane program an initial value to registers `D18F2x9C_x0000_00[52:50]_dct[1:0]` to set the gross and fine delay as specified in [2.10.5.8.2.1 \[DQS Receiver Enable Training Seed Value\]](#).
3. Program `D18F2x9C_x0000_0008_dct[1:0]` to 1.
4. Issue 192 read requests to the target rank. See [2.10.5.8.6 \[Continuous Pattern Generation\]](#). To achieve this, BIOS programs the following:
  - `D18F2x260_dct[1:0]` to 192
  - `D18F2x250_dct[1:0]` to 00b
  - `D18F2x25[8,4]_dct[1:0]` to target rank
  - `D18F2x25[8,4]_dct[1:0]` to 0
  - `D18F2x25[8,4]_dct[1:0]` to 0
5. Program `D18F2x9C_x0000_0008_dct[1:0]` to 0.
6. Read `D18F2x9C_x0000_00[52:50]_dct[1:0]` to get the gross and fine delay values for each lane.
7. For each lane, calculate and program the corresponding receiver enable delay values for `D18F2x9C_x0000_00[2A:10]_dct[1:0]`. Save the result for use later.
  - $DqsRcvEnFineDelay = PhRecFineDly$ .
  - $DqsRcvEnGrossDelay = SeedGross + PhRecGrossDly - SeedPreGross + 1$ .
- For each rank pair on a dual-rank or quad-rank DIMM, compute the average value of the total delays saved during the training of each rank and program the result in `D18F2x9C_x0000_00[2A:10]_dct[1:0]`.

#### 2.10.5.8.2.1 DQS Receiver Enable Training Seed Value

The seed value for pass 1 of receiver enable delay training is design and platform specific. The seed value represents the total delay from a reference point to the left edge of the read preamble on a read CAS measured at the processor pins, in 1 UI/32 increments. The reference point is defined as the clock in which CAS is asserted + CL - 1. The following steps are taken to determine the seed values needed to program the DRAM Phase Recovery Control Registers:

For each pass and each lane:

1. Calculate the total seed based on the following:
  - Pass 1:
    - SeedTotal = The seed value found in [Table 94-Table 96](#) + the total delay value obtained from the first pass of write levelization training. See [2.10.5.8.1 \[Write Levelization Training\]](#).
  - Pass 2 - Pass N:
    - If (RDIMM) then RegisterDelay = ([RC2](#)[AddrCmdPrelaunch] ? 0x30 : 0x20).
    - Else If (LRDIMM) then RegisterDelay = ([F0RC2](#)[AddrCmdPrelaunch] ? 0x30 - (2\*[F1RC12](#)[QCA-PrelaunchDelay] : 0x20) + 0x10.
    - Else RegisterDelay = 0.
    - SeedTotalPreScaling = (the total delay values in [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#) from pass 1 of DQS receiver enable training) - RegisterDelay - 20h.
    - SeedTotal = RegisterDelay + FLOOR(SeedTotalPreScaling\*(target frequency)/(frequency from previous pass)).
2. SeedGross = SeedTotal DIV 32.
3. SeedFine = SeedTotal MOD 32.
4. If (SeedGross is odd)
  - then SeedPreGross = 1
  - else SeedPreGross = 2.
5. Program [D18F2x9C\\_x0000\\_00\[52:50\]\\_dct\[1:0\]](#)[PhRecFineDly] = SeedFine.
6. Program [D18F2x9C\\_x0000\\_00\[52:50\]\\_dct\[1:0\]](#)[PhRecGrossDly] = SeedPreGross.
7. Program [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#)[DqsRcvEnGrossDelay] = SeedGross.

Table 94: BIOS Recommendations for Receiver Enable Training Seed (G34r1)

| Condition |              |         |            | Seed |
|-----------|--------------|---------|------------|------|
| DIMM      | NumDimmSlots | DdrRate | Channel    |      |
| UDIMM     | 1            | 667     | A          | 3Eh  |
|           |              |         | B          | 38h  |
|           |              |         | C          | 37h  |
|           |              |         | D          | 31h  |
|           | 2            |         | A          | 51h  |
|           |              |         | B          | 4Ah  |
|           |              |         | C          | 46h  |
|           |              |         | D          | 3Fh  |
|           | 3            |         | A          | 5Eh  |
|           |              |         | B          | 52h  |
|           |              |         | C          | 48h  |
|           |              |         | D          | 3Ch  |
| RDIMM     | 1            | A       | 43h        |      |

### 2.10.5.8.3 DQS Receiver Enable Cycle Training

Receiver enable delay cycle training is used to train the gross delay settings of [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#) [DRAM DQS Receiver Enable Timing] to the middle of the received read preamble using the phy phase results.

For each rank and lane:

1. Program [D18F2x9C\\_x0D0F\\_0\[F,8:0\]30\\_dct\[1:0\]](#)[BlockRxDqsLock] = 1.
2. RxEnOrig = [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#)[DqsRcvEnGrossDelay, DqsRcvEnFineDelay] result from 2.10.5.8.2 [DQS Receiver Enable Training].
3. RxEnOffset = MOD(RxEnOrig + 10h, 40h)
4. For each DqsRcvEn value beginning from RxEnOffset incrementing by 1 MEMCLK:
  - A. Program [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#)[DqsRcvEnGrossDelay, DqsRcvEnFineDelay] with the current value.
  - B. Perform 2.10.5.8.4 [DQS Position Training].
    - Record the result for the current DqsRcvEn setting as a pass or fail depending if a data eye is found.
5. Process the array of results and determine a pass-to-fail transition.
  - A. DqsRcvEnCycle = the total delay value of the pass result.
  - B. Program [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#)[DqsRcvEnGrossDelay, DqsRcvEnFineDelay] = DqsRcvEnCycle - 10h.
6. Program [D18F2x9C\\_x0D0F\\_0\[F,8:0\]30\\_dct\[1:0\]](#)[BlockRxDqsLock] = 0.

### 2.10.5.8.4 DQS Position Training

DQS position training is used to place the DQS strobe in the center of the read DQ data eye and to center the write DQ data eye across the write DQS strobe. Determining the correct DRAM DQS and DQ delay settings for both reads and writes is conducted by performing a two dimensional search of the delay settings found in

[D18F2x9C\\_x0000\\_0\[3:0\]0\[7:5\]\\_dct\[1:0\]](#) [DRAM Read DQS Timing] and [D18F2x9C\\_x0000\\_0\[3:0\]0\[3:1\]\\_dct\[1:0\]](#) [DRAM Write Data Timing].

Training is accomplished on a per channel, per rank, and per lane basis. For each rank pair on a dual-rank or quad-rank DIMM, BIOS uses the per-lane mutual passing delay values of each rank to calculate the optimal delay values.

For DQS position training, BIOS generates a training pattern using continuous read or write data streams. A 2k-bit-time training pattern is recommended for optimal results. To achieve this, BIOS programs [D18F2x260\\_dct\[1:0\]\[CmdCount\]](#) = 256, [D18F2x250\\_dct\[1:0\]\[CmdTgt\]](#)=01b, and [D18F2x25\[8,4\]\\_dct\[1:0\]](#) to access two different banks of the same CS. See [2.10.5.8.6.1 \[DRAM Training Pattern Generation\]](#).

Prior to DQS position training, BIOS must program [D18F2x210\\_dct\[1:0\]\\_nbp\[3:0\]\[MaxRdLatency\]](#) based on the current greatest value of [D18F2x9C\\_x0000\\_00\[2A:10\]\\_dct\[1:0\]](#). See [2.10.5.8.5 \[Calculating MaxRdLatency\]](#).

The following describes the steps used for DQS position training for each channel:

For each rank and lane:

1. Select a 64 byte aligned test address.
2. For each write data delay value in [D18F2x9C\\_x0000\\_0\[3:0\]0\[3:1\]\\_dct\[1:0\]](#) from Wr-DQS to Wr-DQS plus 1 UI, using the Wr-DQS delay value found in [2.10.5.8.1 \[Write Levelization Training\]](#):
  - A. Program the write data delay value for the current lane.
  - B. Write the DRAM training pattern to the test address.
  - C. For each read DQS delay value in [D18F2x9C\\_x0000\\_0\[3:0\]0\[7:5\]\\_dct\[1:0\]](#) from 0 to 1 UI:
    - i. Program the read DQS delay value for the current lane.
    - ii. Read the DRAM training pattern from the test address.
    - iii. Record the result for the current settings as a pass or fail depending if the pattern is read correctly.
3. Process the array of results and determine the longest string of consecutive passing read DQS delay values.
  - If the read DQS delay results for the current lane contain three or more consecutive passing delay values, then program [D18F2x9C\\_x0000\\_0\[3:0\]0\[7:5\]\\_dct\[1:0\]](#) with the average value of the smallest and largest delay values in the string of consecutive passing results.
4. Process the array of results and determine the longest string of consecutive passing write data delay values for the read DQS delay value found in the step above.
  - If the write data delay results for the current lane contain three or more consecutive passing delay values:
    - If **LRDIMM** then
      - Program [D18F2x9C\\_x0000\\_0\[3:0\]0\[3:1\]\\_dct\[1:0\]](#) with the smallest delay value in the string of consecutive passing results plus one third of the difference of the largest and the smallest delay values in the string of consecutive passing results.
      - Else
        - Program [D18F2x9C\\_x0000\\_0\[3:0\]0\[3:1\]\\_dct\[1:0\]](#) with the average value of the smallest and largest delay values in the string of consecutive passing results.

See [Figure 10](#).

### Figure 10: DQS Position Training Example Results

In some cases, a non-zero process, voltage, and temperature dependent insertion delay is added to the DLL programmed read DQS delay. This has the effect of sampling data later than intended and can result in missing the left edge of the passing region when sweeping from 0 to 1 UI because a read DQS delay value of 0 is already in the passing region. Since DQS is periodic, BIOS can recover the missing information by adjusting the algorithm described above to analyze both the in phase data and the data shifted by one bit time at each step of the read DQS delay sweep. See [D18F2x268\\_dctf\[1:0\]\[NibbleErrSts\]](#) and [D18F2x26C\\_dctf\[1:0\]\[NibbleErr180Sts\]](#).

As shown in Figure 11, for each delay setting BIOS records a passing result of  $P_\Phi$  for the data comparison shifted by one bit time if the data at bit times  $N=0, 1, \dots, 6$ , is read correctly when compared against the data written at bit times  $N=1, 2, \dots, 7$ . In the array of results, these passing values make up the left piece of information that had been lost due to insertion delay. In order to process the array of results, BIOS calculates the read DQS delay value for a  $P_\Phi$  result as  $RdDqsTime$  minus 1 UI.

**Figure 11: DQS Position Training Insertion Delay Recovery Example Results**

The MaxRdLatency value determines when the memory controller can receive incoming data from the DCTs. Calculating MaxRdLatency consists of summing all the synchronous and asynchronous delays in the path from the processor to the DRAM and back at a given MEMCLK frequency. BIOS incrementally calculates the MaxRdLatency and then finally programs the value into `D18F2x210_dct[1:0]_nbp[3:0][MaxRdLatency]`.

1.  $P = N = T = 0$
2. If ( $D18F2x9C\_x0000\_0004\_dct[1:0][AddrCmdSetup] = 0$  &  $D18F2x9C\_x0000\_0004\_dct[1:0][CsOdtSetup] = 0$  &  $D18F2x9C\_x0000\_0004\_dct[1:0][CkeSetup] = 0$ )  
then  $P = P + 1$   
else  $P = P + 2$
3.  $P = P + (8 - D18F2x210\_dct[1:0]\_nbp[3:0][RdPtrInit]) + 1$

4.  $P = P + 5$
5. If ( $D18F2xA8\_dct[1:0][SubMemclkRegDly] = 0$  &  $D18F2x90\_dct[1:0][UnbuffDimm] = 0$ ) then  $P = P + 2$
6.  $P = P + (2 * (D18F2x200\_dct[1:0][Tcl] - 1 \text{ clocks}))$
7.  $P = P + CEIL(MAX(D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay, DqsRcvEnFineDelay] + D18F2x9C\_x0000\_0[3:0]0[7:5]\_dct[1:0][RdDqsTime] \text{ PCLKs}))$ 
  -
8.  $P = P + 5$
9.  $T = T + 800 \text{ ps}$
10.  $N = (P / (MemClkFreq * 2) + T) * NclkFreq$ 
  - See  $D18F5x1[6C:60][NbDid, NbFid]$  and  $D18F2x88\_dct[1:0][MemClkFreq]$ .
11.  $N = N - 1$ .
12.  $D18F2x210\_dct[1:0]\_nbp[3:0][MaxRdLatency] = CEIL(N) - 1$

#### 2.10.5.8.5.1 MaxRdLatency Training

After DRAM DQS receiver enable training, BIOS optimizes  $D18F2x210\_dct[1:0]\_nbp[3:0][MaxRdLatency]$  using the following algorithm. For MaxRdLatency training, BIOS generates a training pattern using continuous read or write data streams. See 2.10.5.8.6.1 [DRAM Training Pattern Generation].

For each channel:

1. Calculate a starting MaxRdLatency delay value by executing the steps in 2.10.5.8.5, excluding steps 4, 8, and 11.
2. Select 32 64-byte aligned test addresses associated with the DIMM that has the worst case ( $D18F2x9C\_x0000\_00[2A:10]\_dct[1:0][DqsRcvEnGrossDelay, DqsRcvEnFineDelay] + D18F2x9C\_x0000\_0[3:0]0[7:5]\_dct[1:0][RdDqsTime]$ ) register setting.
3. Write the DIMM test addresses with the training pattern.
4. For each MaxRdLatency value incrementing from the value calculated in step 1:
  - A. Program  $D18F2x210\_dct[1:0]\_nbp[3:0][MaxRdLatency]$  with the current value.
  - B. Read the DIMM test addresses.
  - C. Compare the values read against the pattern written.
    - If the pattern is read correctly, go to step 5.
  - D. Write to  $D18F2x9C\_x0000\_0050$ .
5. Program  $D18F2x210\_dct[1:0]\_nbp[3:0][MaxRdLatency] = CEIL(\text{current value} + 1 \text{ NCLK} + 1.5 \text{ MEM-CLK})$ .

#### 2.10.5.8.6 Continuous Pattern Generation

DRAM training relies on the ability to generate a string of continuous reads or writes between the processor and DRAM, such that worst case electrical interactions can be created. This section describes how these continuous strings of accesses may be generated.

##### 2.10.5.8.6.1 DRAM Training Pattern Generation

DRAM training pattern generation uses PRBS generators in the DCT to generate controlled read and write traffic streams. During write pattern generation, data values based off of the seeded PRBS are burst to the DRAM interface. Conversely for reads, data bursts from the DRAM interface are compared against expected data values based off of the seeded PRBS on a per nibble basis.

Two address modes are available for DRAM training pattern generation, as configured by  $D18F2x250\_dct[1:0][CmdTgt]$ . For generating a stream of reads or writes to the same rank, address target A

mode is used. To generate a stream of accesses to up to two different ranks, address target A and B mode is used.

An overview of the BIOS sequence to generate training patterns is as follows:

- Configure the DCT for pattern generation. See [2.10.5.6 \[DCT Training Specific Configuration\]](#).
- Ensure DIMMs are configured for 8-beat burst length mode. See [2.10.5.7.1.1 \[DDR3 MR Initialization\]](#).
- Wait for `D18F2x250_dct[1:0][CmdSendInProg] = 0`.
- Program `D18F2x250_dct[1:0][CmdTestEnable] = 1`.
- Send activate commands as appropriate. See [2.10.5.8.6.1.1 \[Activate and Precharge Command Generation\]](#).
- Send read or write commands as desired. See [2.10.5.8.6.1.2 \[Read and Write Command Generation\]](#).
- Send precharge commands as appropriate. See [2.10.5.8.6.1.1 \[Activate and Precharge Command Generation\]](#).
- Program `D18F2x250_dct[1:0][CmdTestEnable] = 0`.

#### 2.10.5.8.6.1.1 Activate and Precharge Command Generation

Prior to sending read or write commands, BIOS must send an activate command to a row in a particular bank of the DRAM devices for access. To send an activate command, BIOS performs the following steps:

- Program `D18F2x28C_dct[1:0]` to the desired address as follows:
  - `CmdChipSelect = CS[7:0]`.
  - `CmdBank = BA[2:0]`.
  - `CmdAddress = A[17:0]`.
- Program `D18F2x28C_dct[1:0][SendActCmd] = 1`.
- Wait until `D18F2x28C_dct[1:0][SendActCmd] = 0`.
- Wait 75 MEMCLKs.

After completing its accesses, BIOS must deactivate open rows in the DRAM devices. To send a precharge or precharge all command to deactivate open rows in a bank or in all banks, BIOS performs the following steps:

- Wait 25 MEMCLKs.
- Program `D18F2x28C_dct[1:0]` to the desired address as follows:
  - `CmdChipSelect = CS[7:0]`.
  - Precharge all command:
    - `CmdAddress[10] = 1`.
  - Precharge command:
    - `CmdAddress[10] = 0`.
    - `CmdBank = BA[2:0]`.
- Program `D18F2x28C_dct[1:0][SendPchgCmd] = 1`.
- Wait until `D18F2x28C_dct[1:0][SendPchgCmd] = 0`.
- Wait 25 MEMCLKs.

On an activate command, the LRDIMM stores the address of the physical rank so it can direct subsequent CAS commands. Therefore, only one row per bank can be active for a logical rank of a LRDIMM.

For LRDIMMs, the behavior of precharge and precharge all commands issued to physical ranks associated with the logical rank selected by `D18F2x28C_dct[1:0][CmdChipSelect]` depends on the setting of F0RC14. In broadcast mode, the command is issued to each physical rank. In rank addressable mode, the command is issued to a specific physical rank BIOS specifies by programming `D18F2x28C_dct[1:0][CmdAddress[17:14]]`.

See [2.10.11.1 \[LRDIMM Rank Multiplication\]](#).

### 2.10.5.8.6.1.2 Read and Write Command Generation

BIOS performs the following steps for read pattern generation:

- Program `D18F2x27C_dct[1:0]`, `D18F2x278_dct[1:0]`, and `D18F2x274_dct[1:0]` with the data comparison masks for bit lanes of interest.
- Program `D18F2x270_dct[1:0][DataPrbsSeed]` the seed for the desired PRBS.
- Program `D18F2x260_dct[1:0][CmdCount]` equal to the number of cache line commands.
- Program `D18F2x25[8,4]_dct[1:0]` to the initial address.
- Program `D18F2x250_dct[1:0]` as follows:
  - ResetAllErr and StopOnErr as desired. See 2.10.5.8.6.1.3 [PRBS Data Comparison].
  - CmdTgt corresponding to `D18F2x25[8,4]_dct[1:0]`.
  - CmdType = 000b.
  - SendCmd = 1.
- Wait for `D18F2x250_dct[1:0][TestStatus] = 1` and `D18F2x250_dct[1:0][CmdSendInProg] = 0`.
- Program `D18F2x250_dct[1:0][SendCmd] = 0`.
- Read `D18F2x264_dct[1:0]`, `D18F2x268_dct[1:0]`, and `D18F2x26C_dct[1:0]` if applicable.

BIOS performs the following steps for write pattern generation:

- Program `D18F2x270_dct[1:0][DataPrbsSeed]` the seed for the desired PRBS.
- Program `D18F2x260_dct[1:0][CmdCount]` equal to the number of cache line commands desired.
- Program `D18F2x25[8,4]_dct[1:0]` to the initial address.
- Program `D18F2x250_dct[1:0]` as follows:
  - CmdTgt corresponding to `D18F2x25[8,4]_dct[1:0]`.
  - CmdType = 001b.
  - SendCmd = 1.
- Wait for `D18F2x250_dct[1:0][TestStatus] = 1` and `D18F2x250_dct[1:0][CmdSendInProg] = 0`.
- Program `D18F2x250_dct[1:0][SendCmd] = 0`.

BIOS combines the two sets of steps listed above for alternating write and read pattern generation.

### 2.10.5.8.6.1.3 PRBS Data Comparison

The DCT compares the incoming read data against the expected PRBS sequence specified by `D18F2x270_dct[1:0][DataPrbsSeed]` during pattern generation. BIOS may choose to continue command generation and accumulate errors or stop command generation on the first error occurrence by programming `D18F2x250_dct[1:0][StopOnErr]`. Error information is reported via `D18F2x264_dct[1:0]`, `D18F2x268_dct[1:0]`, `D18F2x26C_dct[1:0]`, `D18F2x294_dct[1:0]`, `D18F2x298_dct[1:0]`, and `D18F2x29C_dct[1:0]` and can be masked on per-bit basis by programming `D18F2x274_dct[1:0]`, `D18F2x278_dct[1:0]`, and `D18F2x27C_dct[1:0]`. BIOS resets the error information by programming `D18F2x250_dct[1:0][ResetAllErr]=1`.

Error information is only valid in certain modes of `D18F2x250_dct[1:0][CmdType, CmdTgt]` and `D18F2x260_dct[1:0][CmdCount]` and when using 64 byte aligned addresses in `D18F2x25[8,4]_dct[1:0][TgtAddress]`. Some modes require a series of writes to setup a DRAM data pattern. See Table 97.

**Table 97. Command Generation and Data Comparison**

| Commands   | CmdType | CmdTgt           | Maximum CmdCount |
|------------|---------|------------------|------------------|
| Read       | 000b    | 00b <sup>1</sup> | 128              |
|            |         | 01b <sup>1</sup> | 256 <sup>2</sup> |
| Write-Read | 010b    | 00b              | Infinite         |
|            |         | 01b <sup>3</sup> | 256 <sup>2</sup> |

1. Requires setup writes to store a data pattern in DRAM. The write commands are generated using the same CmdTgt, CmdCount, and DataPrbsSeed settings.
2. D18F2x254[TgtAddress] != D18F2x258[TgtAddress].
3. Requires setup writes to store a data pattern in DRAM. The write commands are generated programming D18F2x254[TgtAddress] to the intended Target B, CmdTgt=00b, CmdCount to 1/2 of the intended command count, and the same DataPrbsSeed setting.

### 2.10.5.9 DRAM Channel Disable

The following steps are performed to disable an unused DRAM channel:

For the channel to be disabled:

1. Program D18F2x9C\_x0000\_000C\_dct[1:0][CKETri] = 11b.
2. Wait 24 MEMCLKs.
3. Program D18F2x94\_dct[1:0][DisDramInterface] = 1.

### 2.10.5.10 DRAM Phy Power Savings

For power savings, BIOS should perform the following actions for each channel:

1. Program D18F2x88\_dct[1:0][MemClkDis] to disable unused MEMCLK pins.
2. Program D18F2x9C\_x0D0F\_2[F,2:0]30\_dct[1:0][PwrDn] for unused MEMCLK pairs.
3. Program D18F2x9C\_x0000\_000C\_dct[1:0][CKETri, ODTTri, ChipSelTri] to disable unused pins.
4. Program D18F2x9C\_x0D0F\_0[F,8:0]13\_dct[1:0][DlIDisEarlyU] = 1.
5. Program D18F2x9C\_x0D0F\_0[F,8:0]13\_dct[1:0][DlIDisEarlyL] = 1.
6. D18F2x9C\_x0D0F\_0[F,8:0]13\_dct[1:0][RxDqsUDllPowerDown] = IF (D18F2x90\_dct[1:0][X4Dimm]==0) THEN 1 ELSE 0 ENDIF.
7. D18F2x9C\_x0D0F\_812F\_dct[1:0][PARTri] = ~D18F2x90\_dct[1:0][ParEn].
8. D18F2x9C\_x0D0F\_812F\_dct[1:0][Add17Tri, Add16Tri] = {1b, 1b} IF (D18F2x94\_dct[1:0][MemClk-Freq] <= 800 MHz && ~(mixed channel of x4 and x8 DIMMs)) THEN Program D18F2x9C\_x0D0F\_0[F,8:0]10\_dct[1:0][EnRxPadStandby] = 1. ### 2.10.5.10.1 Platform Specific DRAM Phy Tristate Recommendations

BIOS programs the appropriate tri-state or disable register with the values provided below based on the platform and DIMM population. These tables document settings for motherboards which meet the relevant motherboard design guidelines.

Table 98: BIOS Recommendations for CKETri, ODTTri, ChipSelTri, MemClkDis ([G34r1](#), [UDIMM](#))

### 2.10.6 Memory Interleaving Modes

The processor supports three different types of memory interleaving modes:

- Chip select: interleaves the physical address space over multiple DIMM ranks on a channel, as opposed to each DIMM owning single consecutive address spaces. See 2.10.6.1 [Chip Select Interleaving].
- Channel: interleaves the physical address space over multiple channels, as opposed to each channel owning single consecutive address spaces. See 2.10.6.2 [Channel Interleaving].
- Node: interleaves the physical address space over multiple nodes, as opposed to each node owning single consecutive address spaces. See 2.10.6.3 [Node Interleaving].

Any combination of these interleaving modes may be enabled concurrently. In addition, it is possible to remap

the physical addresses corresponding to an interleaved region of memory. See [Table 105](#) and [D18F2x10C](#).

**Table 105. Recommended interleave configurations**

| Interleaving Mode  | Enabled  | Disabled  |
|--|--|---|
| Chip Select Interleaving   | Number of chip selects installed on the channel is a power of two.                               | Requirements not satisfied.   |
| Channel Interleaving   | DIMMs are present on both channels.  | Requirements not satisfied.   |
| Node Interleaving  | Programmed specific to the current platform configuration.                                       | Programmed specific to the current platform configuration or requirements not satisfied.      |
| Interleave Region Remapping <sup>1</sup>                                 | UMA and DIMMs are present on both channels and the channels do not have the same amount of DRAM. | ~UMA or both channels have the same amount of DRAM or DIMMs are not present on both channels. |
| 1. The channel interleave region should always include the frame buffer. |  |   |

### 2.10.6.1 Chip Select Interleaving

The chip select memory interleaving mode has the following requirements:

- The number of chip selects interleaved is a power of two.
- The chip selects are the same size and type.

A BIOS algorithm for programming [D18F2x\[5C:40\]\\_dct\[1:0\]](#) [DRAM CS Base Address] and [D18F2x\[6C:60\]\\_dct\[1:0\]](#) [DRAM CS Mask] in memory interleaving mode is as follows:

1. Program all DRAM CS Base Address and DRAM CS Mask registers using contiguous normalized address mapping.
2. For each enabled chip select, swap the corresponding BaseAddr[38:27] bits with the BaseAddr[21:13] bits as defined in [Table 106](#).
3. For each enabled chip select, swap the corresponding AddrMask[38:27] bits with the AddrMask[21:13] bits as defined in [Table 106](#).

**Table 106. DDR3 Swapped Normalized Address Lines for CS Interleaving**

| DIMM Address Map <sup>1</sup> | Chip Select Size <sup>2</sup> | Swapped Base Address and Address Mask bits <sup>2</sup> |                       |                       |
|-------------------------------|-------------------------------|---|-----------------------|-----------------------|
|                               |                               | 8 way CS interleaving                                   | 4 way CS interleaving | 2 way CS interleaving |
| 0001b                         | 256-MB                        | [30:28] and [18:16]                                     | [29:28] and [17:16]   | [28] and [16]         |
| 0010b                         | 512-MB                        | [31:29] and [18:16]                                     | [30:29] and [17:16]   | [29] and [16]         |
| 0101b                         | 1-GB, 2-GB, 4-GB              | [32:30] and [18:16]                                     | [31:30] and [17:16]   | [30] and [16]         |
| 0110b                         | 1-GB                          | [32:30] and [19:17]                                     | [31:30] and [18:17]   | [30] and [17]         |

| 1010b  | 4-GB, 8-GB, 16-GB             | [34:32] and [18:16]                                     | [33:32] and [17:16]   | [32] and [16]         |
| 1011b  | 8-GB, 16-GB, 32-GB            | [35:33] and [19:17]                                     | [34:33] and [18:17]   | [33] and [17]         |
| 1100b  | 16-GB                         | [36:34] and [20:18]                                     | [35:34] and [19:18]   | [34] and [18]         |
| <ol style="list-style-type: none"> <li>See <a href="#">D18F2x80_dct[1:0]</a> [DRAM Bank Address Mapping].</li> <li>For LRDIMMs BIOS adds an offset to the bit positions specified based on <a href="#">D18F2x[6C:60]_dct[1:0]</a>[RankDef] as follows:<br/> RankDef=0xb: 0<br/> RankDef=10b: 1<br/> RankDef=11b: 2 </li> </ol> |                               |   |                       |                       |

The following is an example of interleaving a 64-bit interface to DDR3 DRAM. The DRAM memory consists of two 512 MB dual rank DDR3 DIMMs.

- The register settings for contiguous memory mapping are:
  - [D18F2x80\\_dct\[1:0\]](#) = 0000\_0011h. // CS0/1 = 256 MB; CS2/3 = 256 MB
  - [D18F2x40](#) = 0000\_0001h. // 0 MB base
  - [D18F2x44](#) = 0010\_0001h. // 256 MB base = 0 MB + 256 MB
  - [D18F2x48](#) = 0020\_0001h. // 512 MB base = 256 MB + 256 MB
  - [D18F2x4C](#) = 0030\_0001h. // 768 MB base = 512 MB + 256 MB
  - [D18F2x60](#) = 0008\_3FE0h. // CS0/CS1 = 256 MB
  - [D18F2x64](#) = 0008\_3FE0h. // CS2/CS3 = 256 MB
- The base address bits to be swapped are defined in [Table 106](#), 256MB chip select size, 4 way CS interleaving column. The BaseAddr[29:28] bits are specified by [D18F2x\[5C:40\]\\_dct\[1:0\]](#)[BaseAddr[21:20]]. The BaseAddr[17:16] bits are specified by [D18F2x\[5C:40\]\\_dct\[1:0\]](#)[BaseAddr[9:8]].
  - [D18F2x40](#) = 0000\_0001h.
  - [D18F2x44](#) = 0000\_0101h.
  - [D18F2x48](#) = 0000\_0201h.
  - [D18F2x4C](#) = 0000\_0301h.
- The AddrMask bits to be swapped are the same as the BaseAddr bits defined in the previous step. The AddrMask[29:28] bits are specified by [D18F2x\[6C:60\]\\_dct\[1:0\]](#)[AddrMask[21:20]]. The AddrMask[17:16] bits are specified by [D18F2x\[6C:60\]\\_dct\[1:0\]](#)[AddrMask[9:8]].
  - [D18F2x60](#) = 0038\_3CE0h.
  - [D18F2x64](#) = 0038\_3CE0h.

### 2.10.6.2 Channel Interleaving

The channel memory interleaving mode requires that DIMMs are present on both channels. Channel interleaving is enabled by programming [D18F2x110](#)[DctSelIntLvEn] and [D18F2x110](#)[DctSelIntLvAddr] to specify how interleaving is performed between the DCTs. If the channels do not have the same amount of DRAM, [D18F2x110](#)[DctSelBaseAddr, DctSelHi, DctSelHiRngEn] are used to configure the interleaved region. See also [2.10.7 \[Memory Hoisting\]](#).

### 2.10.6.3 Node Interleaving

The node memory interleaving mode has the following requirements:

- All nodes in the system must contain the same amount of DRAM.
- All the DRAM of all nodes in the system must be node interleaved.
- The base and limit registers for all nodes must be programmed to 0 and top of memory, respectively.
- All DRAM channels in the system must have the same amount of DRAM on the respective channel across all nodes.
- [D18F2x110\[DctSelIntLvAddr\]](#)==01b not supported.

Node interleaving for up to 8 nodes is controlled by [D18F1x\[17C:140,7C:40\]](#)[IntlvEn and IntlvSel], [D18F1x120\[DramIntlvSel\]](#) and [D18F1x124\[DramIntlvEn\]](#). IntlvEn and DramIntlvEn are programmed to specify the interleaved address bits (programmed the same in each node). IntlvSel specifies the value that those address bits need to be to target a node (must be programmed to a different value for each node). DramIntlvSel specifies the value of those address bits for the local node. It is expected that one [D18F1x\[17C:140,7C:40\]](#) [DRAM Base/Limit] pair is enabled per node; one of these pairs selects the local node by having an IntlvSel value that matches [D18F1x120\[DramIntlvSel\]](#); IntlvEn is the same in all [D18F1x\[17C:140,7C:40\]](#) [DRAM Base/Limit] pairs and the same as [D18F1x124\[DramIntlvEn\]](#) of all nodes. For example, a 4-node system would normally be programmed as follows for interleaving:

|   |   |
|---|---|
| <b>Node 0</b><br>- IntlvEn = 011b<br>- IntlvSel = 000b<br>- Addr[13:12] = 00b | <b>Node 1</b><br>- IntlvEn = 011b<br>- IntlvSel = 001b<br>- Addr[13:12] = 01b |
| <b>Node 2</b><br>- IntlvEn = 011b<br>- IntlvSel = 010b<br>- Addr[13:12] = 10b | <b>Node 3</b><br>- IntlvEn = 011b<br>- IntlvSel = 011b<br>- Addr[13:12] = 11b |

### 2.10.7 Memory Hoisting

Memory hoisting reclaims the otherwise inaccessible DRAM that would naturally reside in memory regions used by MMIO and HyperTransport™. When memory hoisting is configured by BIOS, DRAM physical addresses are repositioned above the 4 GB address level in the address map. In operation, the physical addresses are remapped in hardware to the normalized addresses used by a DCT.

The region of DRAM that is hoisted is defined to be from [D18F1xF0\[DRAMHoleBase\]](#) to the 4 GB level. Hoisting is enabled by programming [D18F1xF0 \[DRAM Hole Address\]](#) and configuring the DCTs per the equations in this section.

DramHoleSize is defined in order to simplify the following equations in this section and is calculated as follows:

- Define the DRAM hole region as [DramHoleSize\[31:24\]](#) = 100h - [D18F1xF0\[DRAMHoleBase\[31:24\]\]](#).

### 2.10.7.1 DramHoleOffset Programming

D18F1xF0[DramHoleOffset] is programmed based on the scenarios shown in Figure 12:

- **Case 1:** If D18F2x110[DctSelHiRngEn] = 0 OR D18F2x110[DctSelHiRngEn] = 1 AND DctSelBaseAddr > DramHoleBase then:  
DramHoleOffset[31:23] = {DramHoleSize[31:24], 0b} + {DramBaseAddr[31:27], 0000b};
- **Case 2:** If D18F2x110[DctSelIntLvEn] = 0 AND D18F2x110[DctSelHiRngEn] = 1 AND DctSelBaseAddr < DramHoleBase then:  
DramHoleOffset[31:23] = {DramHoleSize[31:24], 0b} + {DctSelBaseAddr[31:27], 0000b};
- **Case 3:** If D18F2x110[DctSelIntLvEn] = 1 AND D18F2x110[DctSelHiRngEn] = 1 AND DctSelBaseAddr < DramHoleBase then  
DramHoleOffset[31:23] = {DramHoleSize[31:24], 0b} + {DramBaseAddr[31:27], 0000b}  
+ {0b, (DctSelBaseAddr[31:27] - DramBaseAddr[31:27]), 000b};

Figure 12: Example Cases for Programming DramHoleOffset

### 2.10.7.2 DctSelBaseOffset Programming

When D18F2x110[DctSelHiRngEn] = 1, D18F2x114[DctSelBaseOffset] is programmed based on the scenarios shown in Figure 13:

- **Case 1:** If D18F2x110[DctSelIntLvEn] = 0 then:  
DctSelBaseOffset[47:26] = {DctSelBaseAddr[47:27], 0b};
- **Case 2:** If D18F2x110[DctSelIntLvEn] = 1 AND (D18F1xF0[DramHoleValid] = 1 AND DctSelBaseAddr < DramHoleBase OR D18F1xF0[DramHoleValid] = 0) then:  
DctSelBaseOffset[47:26] = {DramBaseAddr[47:27], 0b}  
+ {0b, (DctSelBaseAddr[47:27] - DramBaseAddr[47:27])};
- **Case 3:**
  - If D18F2x110[DctSelIntLvEn] = 1 AND D18F1xF0[DramHoleValid] = 1 AND DctSelBaseAddr > DramHoleBase then:  
DctSelBaseOffset[47:26] = {DramBaseAddr[47:27], 0b}  
+ {0000h, DramHoleSize[31:26]}  
+ {0b, (DctSelBaseAddr[47:27] - DramBaseAddr[47:27]) - {0000h, (DramBaseAddr[31:27] + DramHoleSize[31:27])}};

**Figure 13: Example Cases for Programming DctSelBaseOffset**

## 2.10.8 DRAM CC6 Storage

DRAM is used to hold the state information of cores entering the CC6 power management state. As part of the system setup if CC6 is enabled, BIOS configures a special region of DRAM to hold the state information. In operation, hardware protects this region from general system accesses while allowing the cores access during C-state transitions.

The size of each special DRAM storage region on a node is defined to be a fixed 16MB.

For single node systems, BIOS configures the storage region at the top of the DRAM range and adjusts [D18F1x\[17C:140,7C:40\]\[DramLimit\]](#) downward accordingly. BIOS sets [D18F4x128\[CoreStateSaveDestNode\] = D18F0x60\[NodeId\]](#).

For multiple node systems, BIOS sets [D18F4x128\[CoreStateSaveDestNode\]](#) equal to the [D18F0x60\[NodeId\]](#) of the node at the top of the DRAM address map and adjusts [D18F1x\[17C:140,7C:40\]\[DramLimit\]](#) downward accordingly. If node interleaving is enabled by [D18F1x\[17C:140,7C:40\]\[IntlvEn\]](#), the amount of system memory available is reduced by 16MB \* the number of nodes. In this case, BIOS sets [D18F4x128\[CoreStateSaveDestNode\] = D18F0x60\[NodeId\]](#) for each node.

See [Table 107](#), [Table 108](#), and [Table 109](#).

After finalizing the system DRAM configuration, BIOS must set [D18F2x118\[LockDramCfg\]=1](#) to enable the hardware protection.

**Table 107. Single Node Example**

| Node | DRAM Populated | <a href="#">D18F1x[17C:140,7C:40][DramBase, DramLimit]</a> | CC6 DRAM Range        | <a href="#">D18F4x128[CoreStateSaveDestNode]</a> | <a href="#">D18F1x120[DramBaseAddr]</a> ,<br><a href="#">D18F1x124[DramLimitAddr]</a> |

### 2.10.9 On-Line Spare

On-line spare is a RAS mechanism that allows the system to reserve one rank of a DIMM to be used as a spare rank. System software reserves a spare rank (logical rank for LRDIMMs) by setting D18F2x[5C:40]\_dct[1:0][Spare] in one of the CS Base address registers. D18F2x80\_dct[1:0] and D18F2x[6C:60]\_dct[1:0][RankDef] are configured specific to the spare DIMM. The spare rank must be greater than or equal to the size of all other ranks on the channel.

The system can switch to the spare rank when system software determines that one of the ranks in the system is no longer functioning properly and needs to be replaced. The on-line spare mechanism is controlled by D18F3xB0 [On-Line Spare Control]. System software initiates the swap to the spare rank by writing the chip select number of the bad rank to D18F3xB0[BadDramCS1, BadDramCS0] and setting D18F3xB0[SwapEn1, SwapEn0]. The spare rank inherits in hardware the D18F2x[5C:40]\_dct[1:0][BaseAddr] and D18F2x[6C:60]\_dct[1:0][AddrMask] values from the bad rank.

On-line spare is not supported in UMA systems.

#### 2.10.9.1 On-Line Spare and CS Interleaving

The on-line spare feature can only be used with 2 way and 4 way CS interleaving, under the following conditions.

- All ranks of each DIMM (logical ranks for LRDIMMs) present must be of the same size and configuration.
- Table 110 lists the supported DIMM populations.
  - BIOS sets Spare on one CS of one of the DIMMs with smallest number of ranks. When the TestFail column is indicated, BIOS sets TestFail on the CS that shares a CS Mask register with the spare rank.

**Table 110. On-Line Spare and CS Interleaving Configurations**

| DIMMs/Ch | SR | DR | QR | CS Interleave Ways | TestFail |
|----------|----|----|----|--------------------|----------|
| 1        | -  | -  | 1  | 2                  | 1        |
| 2        | 1  | 1  | -  | 2                  | -        |
|          | 1  | -  | 1  | 4                  | -        |
|          | -  | 2  | -  | 2                  | 1        |
|          | -  | 1  | 1  | 4                  | 1        |
| 3        | 3  | -  | -  | 2                  | -        |
|          | 1  | 2  | -  | 4                  | -        |
|          | -  | 3  | -  | 4                  | 1        |

### 2.10.10 DRAM On DIMM Thermal Management and Power Capping

Each DCT can throttle commands based on the state of the channel EVENT\_L pin (G34r1 and C32r1 packages only) or when [D18F2xA4\[BwCapEn\]](#)=1. The EVENT\_L pin is used for thermal management while [D18F2xA4\[BwCapEn\]](#) limits memory power independent of the thermal management solution. The recommended BIOS configuration for the EVENT\_L pin is as follows:

- BIOS may enable command throttling on a DRAM controller if the platform supports the EVENT\_L pin by programming [D18F2xA4\[ODTSEn\]](#) = 1.
  - The recommended usage is for this pin to be connected to one or more JEDEC defined on DIMM temperature sensors. The DIMM SPD ROM indicates on DIMM temperature sensor support.
  - BIOS configures the temperature sensor(s) to assert EVENT\_L pin active low when the trip point is exceeded and deassert EVENT\_L when the temperature drops below the trip point minus the sensor defined hysteresis.
  - BIOS programs [D18F2xA4\[CmdThrottleMode\]](#) with the throttling mode to employ when the trip point has been exceeded.
  - BIOS programs [D18F2xA4\[ODTSEn, CmdThrottleMode\]](#) only once immediately following DRAM training.
  - The hardware enforces a refresh rate of 3.9 us while EVENT\_L is asserted.
- BIOS configures [D18F2x8C\\_dct\[1:0\]\[Tref\]](#) based on JEDEC defined temperature range options, as indicated by the DIMM SPD ROM. The two defined temperature ranges are normal (with a case temperature of 85 °C) and extended (with a case temperature of 95 °C).
  - On a channel basis, if all DIMMs support the normal temperature range, or if normal and extended temperature range DIMMs are mixed, BIOS programs [D18F2x8C\\_dct\[1:0\]\[Tref\]](#) to 7.8 us and [D18F2xA4\[ODTSEn\]](#) = 1. BIOS configures the temperature sensor trip point for all DIMMs according to the 85 °C case temperature specification.
  - On a channel basis, if all DIMMs support the extended temperature range, BIOS has two options:
    - a. Follow the recommendation for normal temperature range DIMMs.
    - b. Program [D18F2x8C\\_dct\[1:0\]\[Tref\]](#) = 3.9 us and configure the temperature sensor trip point for all DIMMs according to the 95 °C case temperature specification.
- At startup, the BIOS determines if the DRAMs are hot before enabling a DCT and delays for an amount of time to allow the devices to cool under the influence of the thermal solution. This is accomplished by checking the temperature status in the temperature sensor of each DIMM.
- The latched status of the EVENT\_L pin for both DCTs can be read by system software in

[D18F2xAC](#)[MemTempHot1, MemTempHot0].

The relationship between the DRAM case temperature, trip point, and EVENT\_L pin sampling interval is outlined as follows:

- The trip point for each DIMM is ordinarily configured to the case temperature specification minus a guardband temperature for the DIMM.
- The temperature guardband is vendor defined and is used to account for sensor inaccuracy, EVENT\_L pin sample interval, and platform thermal design.
- The sampling interval is vendor defined. It is expected to be approximately 1 second.

APML may enable bandwidth capping on a DRAM controller by setting [MSRC001\\_0079](#)[BwCapEn] = 1 and programming [MSRC001\\_0079](#)[BwCapCmdThrottleMode] with the throttling mode to employ. The DCT will employ the larger of the two throttling percentages as specified by [MSRC001\\_0079](#)[BwCapCmdThrottleMode] and [D18F2xA4](#)[CmdThrottleMode] if the EVENT\_L pin is asserted when both [D18F2xA4](#)[BwCapEn]==1 and [D18F2xA4](#)[ODTSEn]==1.

## 2.10.11 LRDIMM

Processor revisions support JEDEC DDR3 LRDIMMs, which provide load isolation on the DRAM address, command, and data buses, and allows the DCT to support larger DRAM capacities.

### 2.10.11.1 LRDIMM Rank Multiplication

LRDIMMs support a rank multiplication feature which allows more than 4 physical ranks per-DIMM while using a RDIMM compatible connector. Physical ranks are accessed on the LRDIMM by specifying a logical rank of either S0 or S1 and then selecting a physical rank via extended address bits on MA[15:14], S2, and S3 depending on the DRAM devices.

The DCT supports LRDIMM rank multiplication modes using extended row address bits as shown in [Table 159](#). BIOS enables rank multiplication mode by programming [D18F2x\[6C:60\]\\_dct\[1:0\]](#)[RankDef]. [D18F2xA8\\_dct\[1:0\]](#)[CsMux67, CsMux45] must also be configured to agree with the F0RC15 control word and in accordance with the relevant AMD motherboard design guideline.

## 2.11 Thermal Functions

Thermal functions HTC, PROCHOT\_L and THERMTRIP are intended to maintain processor temperature in a valid range by:

- Providing a signal to external circuitry for system thermal management like fan control.
- Lowering power consumption by switching to lower-performance P-state.
- Sending processor to the THERMTRIP state to prevent physical damage.

The processor thermal-related circuitry includes (1) the temperature calculation circuit (TCC) for determining the temperature of the processor and (2) logic that uses the temperature from the TCC.

•

### 2.11.1 The Tctl Temperature Scale

Tctl is a processor temperature control value used for processor thermal management. Tctl is accessible through [D18F3xA4](#)[CurTmp]. Tctl is a temperature on its own scale aligned to the processors cooling requirements. Therefore Tctl does not represent a temperature which could be measured on the die or the case of the processor. Instead, it specifies the processor temperature relative to the maximum operating temperature,

Tctl,max. Tctl,max is specified in the power and thermal data sheet. Tctl is defined as follows for all parts:

A: For  $Tctl = 0$  to  $Tctl\_max - 0.125$ : the temperature of the part is  $[Tctl\_max - Tctl]$  under the maximum operating temperature.

B: For  $Tctl = Tctl\_max$  to  $255.875$ : the temperature of the part is  $[Tctl - Tctl\_max]$  over the maximum operating temperature. The processor may take corrective actions that affects performance, such as HTC, to support the return to Tctl range A.

**Figure 14: Tctl scale**

### 2.11.2 Temperature-Driven Logic

The temperature calculated by the TCC is used by HTC, THERMTRIP, and PROCHOT\_L.

#### 2.11.2.1 PROCHOT\_L and Hardware Thermal Control (HTC)

The processor *HTC-active state* is characterized by (1) the assertion of PROCHOT\_L, (2) reduced power consumption, and (3) reduced performance. While in the HTC-active state, the processor reduces power consumption by limiting all cores to a P-state (specified by [D18F3x64\[HtcPstateLimit\]](#)). See [2.5.2 \[P-states\]](#). While in the HTC-active state, software should not change the following: All [D18F3x64](#) fields (except for HtcActSts and HtcEn). Any change to the previous list of fields when in the HTC-active state can result in undefined behavior. HTC status and control is provided through [D18F3x64](#).

The PROCHOT\_L pin acts as both an input and as an open-drain output. As an output, PROCHOT\_L is driven low to indicate that the HTC-active state has been entered due to an internal condition. The minimum assertion and deassertion time for PROCHOT\_L is 200  $\mu$ s with a minimum period of 2 ms.

The processor enters the HTC-active state if all of the following conditions are true:

- [D18F3xE8\[HtcCapable\]](#)=1
- [D18F3x64\[HtcEn\]](#)=1
- PWROK=1
- THERMTRIP\_L is deasserted.
- The processor is not in the C3 ACPI state.

and any of the following conditions are true:

- Tctl is greater than or equal to the HTC temperature limit ([D18F3x64\[HtcTmpLmt\]](#)).
- PROCHOT\_L is asserted.

The processor exits the HTC-active state when all of the following are true:

- Tctl is less than the HTC temperature limit ([D18F3x64\[HtcTmpLmt\]](#)).
- Tctl has become less than the HTC temperature limit ([D18F3x64\[HtcTmpLmt\]](#)) minus the HTC hysteresis limit ([D18F3x64\[HtcHystLmt\]](#)) since being greater than or equal to the HTC temperature limit ([D18F3x64\[HtcTmpLmt\]](#)).
- PROCHOT\_L is deasserted.

The default value of the HTC temperature threshold (Tctl\_max) is specified in the Power and Thermal Data-sheet.

### 2.11.2.2 Software P-state Limit Control

[D18F3x68 \[Software P-state Limit\]](#) provides a software mechanism to limit the P-state [MSRC001\\_0061\[CurP-stateLimit\]](#). See [2.5.2 \[P-states\]](#).

### 2.11.2.3 THERMTRIP

If the processor supports the THERMTRIP state (as specified by [D18F3xE4 \[Thermtrip Status\]\[ThermtpEn\]](#) or [CPUID Fn8000\\_0007\\_EDX\[TTP\]](#), which are the same) and the temperature approaches the point at which the processor may be damaged, the processor enters the THERMTRIP state. The THERMTRIP function is enabled after cold reset (after PWROK asserts and RESET\_L deasserts). It remains enabled in all other processor states, except during warm reset (while RESET\_L is asserted). The THERMTRIP state is characterized as follows:

- The THERMTRIP\_L signal is asserted.
- Nearly all clocks are gated off to reduce dynamic power.
- A low-value VID is generated.
- In addition, the external chipset is expected to place the system into the S5 ACPI state (power off) if THERMTRIP\_L is detected to be asserted.

A cold reset is required to exit the THERMTRIP state.

## 2.12 Links

A *link* is a block of link signals, including 16 CAD signals, 2 CTL signals, and 2 CLK signals. Links may support unganged modes in which subgroups of link signals--or *sublinks*--are connected to separate devices, as specified by [D18F3xE8 \[Northbridge Capabilities\]\[UnGangEn\]](#). Links may operate per coherent protocol or IO protocol. The electrical definition is per various revisions of the link specification; the terminology for these modes is as follows:

- Gen1: refers to link rates of 0.4 to 1.6 GT/s in the revision 1 specification or 2.0 GT/s in the revision 2 spec-

ification.

- **G34r1**: 1.0 GHz disallowed for links connecting internal nodes as indicated by **D18F0x1A0**[IntLnk-Route]. See **D18F0x[E8,C8,A8,88]**[Freq[3:0]].
- **AM3r2**: 0.4-1.0 GHz disallowed for AM3r2 package. 0.2 GHz supported only as boot frequency to first warm reset; 0.2 GHz disallowed as operational frequency. See **D18F0x[E8,C8,A8,88]**[Freq[3:0]].
- Gen3: refers to link rates of 2.4 to 6.4 GT/s in the revision 3 specification. 2.4 GT/s and 3.2 GT/s are supported as specified in the revision 3 specification only, not as specified in the revision 2 specification.

## 2.12.1 Link Initialization

### 2.12.1.1 Ganging And Unganging

The following combinations of maximum bit widths (it is always possible to connect to a device using a supported, narrower bit width), protocols, and frequencies are supported:

- One 16-bit link (ganged); either IO or coherent protocol; any supported link frequency. In ganged mode, the link may or may not be left unconnected. In ganged mode, registers that control sublink 0 control the entire link; registers that control sublink 1 are reserved.
- Two 8-bit links (unganged); the two sublinks may be configured for any combination of IO or coherent protocol; if the two link frequencies are the same, then they may be any supported frequency; if the two link frequencies are different, then they are required to be one of the following ratios to each other: 8:1, 6:1, 4:1, 2:1; legal combinations are {5.6, 2.8}, {6.4, 3.2}, {6.4, 1.6}, {6.4, 0.8}, {2.4, 0.4}, {4.8, 0.8}, {4.8, 2.4}, {4.8, 1.2}, {4.0, 2.0}, {3.2, 1.6}, {3.2, 0.8}, {3.2, 0.4}, {2.4, 1.2}, {1.6, 0.8}, {1.6, 0.4}, and {0.8, 0.4} GT/s. The following combinations are allowed for test and debug purposes: {6.4, 0.8}, {2.4, 0.4}, {4.8, 0.8}, {3.2, 0.8}, {3.2, 0.4}, {1.6, 0.8}, and {1.6, 0.4}. In unganged mode, neither, either, or both of the two 8-bit sublinks may be left unconnected. In unganged mode, sublink 0 refers to the link associated with CLK[0], CTL[0], and CAD[7:0]; sublink 1 refers to the link associated with CLK[1], CTL[1], and CAD[15:8].

### 2.12.1.2 Ganging Detection And Control

If unganging is not supported by the processor (**D18F3xE8**[UnGangEn]), then the links always cold boot to the ganged state.

Otherwise, the ganged state of the links at cold boot is based on the state of CTL[1]. If CTL[1]=0, then the link powers up unganged. If CTL[1]=1, then the link powers up ganged. If CTL[1] is connected between the processor and another device (such as another processor) that supports the Gen3 link specification, then the link cold boots to the unganged state.

If both sublinks of an unganged link connect the same two devices, then initialization software may be used to place these sublinks into the ganged state (**D18F0x[18C:170]**[Ganged]).

Unused upper sublinks should be left disconnected with processor inputs floating to minimize power consumption. Software should not gang inactive sublinks with active sublinks.

### 2.12.1.3 Link Type Detect

The link may be initialized in one of the following states during cold reset:

- The link may be ganged or unganged.
- The link/sublink is not connected with inputs terminated to the proper state to indicate ganged/unganged.
- The link/sublink is not connected with inputs floating (as with a connection to an unpopulated socket).

The processor follows the protocol described in the Gen3 link specification to determine the cold boot state of **D18F0x[18C:170]**[Ganged] and **D18F0x[E4,C4,A4,84]**[TransOff, EndOfChain].

D18F0x[E4,C4,A4,84][TransOff, EndOfChain] are set when the link is unconnected, as follows:

- Unterminated link: no device is detected on the other side of the link.
- DC-coupled links: link is strapped in the unconnected state per the link specification.

### 2.12.1.3.1 Link Specific Registers

The following registers are link specific:

- F[4,0]x[9C:80] are associated with link 0.
- F[4,0]x[BC:A0] are associated with link 1.
- F[4,0]x[DC:C0] are associated with link 2.
- F[4,0]x[FC:E0] are associated with link 3.
- The function 0 registers are associated with the whole link if it is ganged or sublink 0 if it is unganged; the function 4 registers are associated with sublink 1 if the link is unganged.

### 2.12.1.3.2 Unused Links

When both sublinks of a link are unused and disconnected, the clocks to the link are disabled and the following registers become unavailable. Writes to these registers are ignored and reads are undefined.

- D18F3x1[54,50,4C,48].
- D18F0x[F0,D0,B0,90] and D18F4x[F0,D0,B0,90].
- D18F0x[F4,D4,B4,94] and D18F4x[F4,D4,B4,94].
- D18F4x1[98,90,88,80].
- D18F4x1[9C,94,8C,84].

### 2.12.1.4 Legal Topologies

The link may be connected in these configurations:

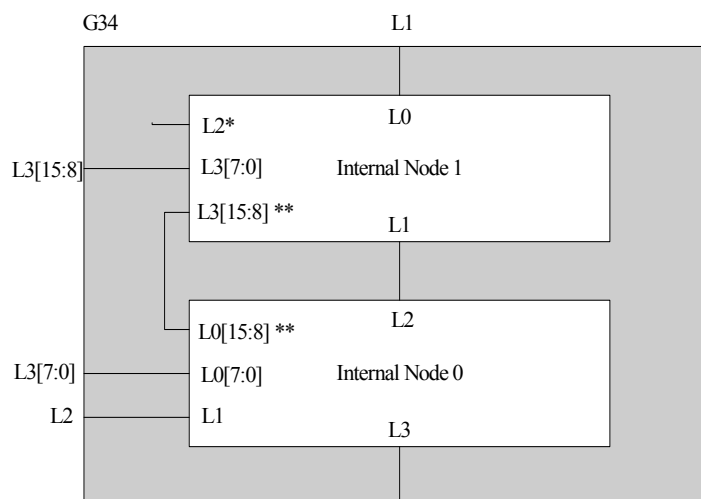

- 16-bit Gen3 device connected (CTL[1] connected)
- 16-bit Gen1 device connected (CTL[1] terminated)
- Unganged:
  - Two 8-bit devices connected
  - One 8-bit device connected to either sublink and the other sublink with inputs terminated
  - One 8-bit device connected to either sublink and the other sublink with inputs floating
- Link inputs terminated
- Link inputs floating

### 2.12.1.5 Link Mapping Between Package and Node

The AM3r2 package maps package link 0 to node link 0.

The C32r1 package maps package link 0 to node link 0, package link 1 to node link 1, and package link 2 to node link 2.

The G34r1 package only supports dual-node processors (D18F3xE8[MultiNodeCpu]=1). The links on the G34r1 package are connected to the links of the internal nodes as shown in [Figure 15](#). See [2.9.3.2 \[Hyper-Transport™ Technology Routing\]](#) for supported system topologies.

\* Link 2 of internal node 1 is not connected L0

\*\* This 8-bit link, while physically connected, is not supported.

**Figure 15: Dual-Node Processor Link Diagram**

Since the internal 8 bit link is not supported, BIOS must do the following for dual-node processors:

For internal node 0 ([D18F3xE8](#)[IntNodeNum]==00b):

- If package link L3[7:0] is connected ([F0x98](#)[LinkCon]==1; see [D18F0x\[F8,D8,B8,98\]](#)):
  - Program [F0x84](#)[WidthIn, WidthOut]=000b. See [D18F0x\[E4,C4,A4,84\]](#).
  - Program [F0x170](#)[Ganged]=1. See [D18F0x\[18C:170\]](#).
- If package link L3[7:0] is not connected ([F0x98](#)[LinkCon]==0; see [D18F0x\[F8,D8,B8,98\]](#)):
  - Program [D18F0x16C](#)[ConnDly]=1.
  - Program [F4x84](#)[TransOff, EndOfChain]=1. See [D18F0x\[E4,C4,A4,84\]](#).

For internal node 1 ([D18F3xE8](#)[IntNodeNum]==01b):

- If package link L3[15:8] is connected ([F0xF8](#)[LinkCon]==1; see [D18F0x\[F8,D8,B8,98\]](#)):
  - Program [F0xE4](#)[WidthIn, WidthOut]=000b. See [D18F0x\[E4,C4,A4,84\]](#).
  - Program [F0x18C](#)[Ganged]=1. See [D18F0x\[18C:170\]](#).
- If package link L3[15:8] is not connected ([F0xF8](#)[LinkCon]==0; see [D18F0x\[F8,D8,B8,98\]](#)):
  - Program [D18F0x16C](#)[ConnDly]=1.
  - Program [F4xE4](#)[TransOff, EndOfChain]=1. See [D18F0x\[E4,C4,A4,84\]](#).

### 2.12.2 Termination and Compensation

The links are designed to operate in DC-termination mode as follows.

**Figure 16: Link DC Termination Mode**

Ron and Rtt are constructed with an array of parallel resistors that can be enabled or disabled to vary the resulting resistance. Each parallel resistor is referred to as a *tap*. Precision external resistors are used by the processor to determine the number of taps that must be enabled in order to match Ron and Rtt to the proper target values. The results of this compensation circuitry are observable in [D18F4x1\[9C,94,8C,84\]\\_xE0 \[Link Phy Compensation and Calibration Control 1\]\[RonRawCal\]](#) and [D18F4x1\[9C,94,8C,84\]\\_xE0 \[Link Phy Compensation and Calibration Control 1\]\[RttRawCal\]](#). Other fields in these registers are provided to offset the raw calculated compensation values or override them.

Compensation updates start after PWROK becomes valid (and occur while RESET\_L is asserted).

The transmitter and receiver tristate in the PHY\_OFF state, as entered by [D18F0x\[E4,C4,A4,84\]\[TransOff\]=1](#).

### 2.12.3 Equalization

A high speed data stream passing through the channel distorts due to various effects. The processor employs equalization to counter this problem and to improve electrical fidelity of the links. Equalization is employed by changing the voltage level transmitted before and after bit transitions. The transmitter can be attenuated to levels that vary based on bit history, as specified by [D18F4x1\[9C,94,8C,84\]\\_x\[7:6\]\[9:0\]\[8,0\]C\\_dm\[1\] \[Link Phy Tx Deemphasis and Margin Test Control\]](#). Equalization is not used at Gen1 frequencies.

### 2.12.4 Link Bandwidth Requirements

The bandwidth of a link may not exceed the bandwidth capacity of the nodes NB. The requirements are as follows:

- Where [NBCOF\\_MIN](#) is the NBCOF for the lowest frequency enabled NB P-state and HTCLK is the frequency of the link clock:
  - [D18F0x\[14C:130\]\[RetryModeEnable\]=1:  \$NBCOF\\_MIN \geq HTCLK / 2\$ .](#)
  - [D18F0x\[14C:130\]\[RetryModeEnable\]=0:  \$NBCOF\\_MIN \geq HTCLK\$ .](#)
- Both sides of the link must satisfy the following rules for all NB P-states:
  - $HTCLK > NBCOF$  for both sides of the link.
  - $HTCLK \leq NBCOF$  for both sides of the link.

### 2.12.5 Link Retry

The links support the error-retry mode described by the link specification, controlled by [D18F0x\[14C:130\] \[Link Retry\]](#) and [D18F0x150 \[Link Global Retry Control\]](#). Some requirements for operation in this mode:

- The processor does not support error-retry mode over links operating at Gen1 frequencies.
- IO links operating at Gen3 frequencies are required to have error-retry enabled. Coherent links operating

at Gen3 frequencies are expected to have error-retry enabled.

- Must be modified only when all links are operating at Gen1 frequency: [D18F0x150](#)[HtRetryCrcDatIns, HtRetryCrcDatInsDynEn, HtRetryCrcCmdPack, HtRetryCrcCmdPackDynEn].
- If any coherent links have error-retry enabled, then all coherent links are required to have it enabled after the coherent fabric has been configured. Until the warm reset to enable retry on all links, only configuration space cycles may be used in the coherent fabric.
- The retry history buffer for each ganged link supports up to 32 packets (each packet may include command and data), 16 packets for each unganged sublink.

### 2.12.6 Link LDTSTOP\_L Disconnect-Reconnect

When disconnected for an LDTSTOP\_L assertion, the state of the link and the reconnect time is a function of the link generation (Gen1 or Gen3) being used (or that the link is changing to, as a result of the LDTSTOP\_L assertion), [D18F0x\[E4,C4,A4,84\]](#)[LdtStopTriEn], and [D18F0x\[18C:170\]](#)[LS2En] as follows:

**Table 111: Link Disconnect Controls**

| Link Gen | LdtStopTriEn | LS2En | CLK                   | CAD, CTL              | Reconnect delay                                  |
|----------|--------------|-------|-----------------------|-----------------------|--|
| Gen1     | 0            | X     | L0 <sup>1</sup>       | L0 <sup>1</sup>       | Fast (about 1 us) <sup>4</sup>                   |
| Gen1     | 1            | 0     | L0 <sup>1</sup>       | High imp <sup>3</sup> | Fast (about 1 us) <sup>4</sup>                   |
| Gen1     | 1            | 1     | High imp <sup>3</sup> | High imp <sup>3</sup> | <a href="#">D18F3xD8</a> [ReConDel] <sup>4</sup> |
| Gen3     | X            | 0     | L0 <sup>1</sup>       | EI <sup>2</sup>       | <a href="#">D18F0x16C</a> [T0Time]               |
| Gen3     | X            | 1     | EI <sup>2</sup>       | EI <sup>2</sup>       | <a href="#">D18F0x16C</a> [T0Time]               |

1. L0 represents the active, driven state.

2. Electrical idle.

3. High impedance.

4. [D18F0x\[E4,C4,A4,84\]](#)[ExtCTL]=1 adds 50 us after CTL asserts.

### 2.12.7 LDTSTOP\_L Requirements

- The processor requires additional minimum LDTSTOP\_L assertion time for certain system configurations.
  - If any of the following system configuration properties are true the minimum LDTSTOP\_L assertion time required by the processor is 10 us:
    - If [CPUID Fn8000\\_0001\\_EBX](#)[PkgType] is [C32r1](#) or [G34r1](#).
    - The system is in the C1E state, caches are not flushed, and [D18F3x\[84:80\]](#)[CpuPrbEn] for C1E is 0.
  - If [CPUID Fn8000\\_0001\\_EBX](#)[PkgType] is [AM3r2](#) then the minimum LDTSTOP\_L assertion time required by the processor is 5 us.
- The processor requires additional STOP\_GRANT to LDTSTOP\_L deassertion time for certain system configurations.
  - LDTSTOP\_L must not deassert less than 15 us after the processor broadcasts the STOP\_GRANT message if [D18F3x\[84:80\]](#)[CpuPrbEn]=1 for the SMAF associated with the STPCLK assertion message and the link is operating at a Gen 1 frequency.
  - For all cases of LDTSTOP\_L assertion, LDTSTOP\_L must not deassert less than 14 us after the processor broadcasts the STOP\_GRANT message.
    - For processors with an NB COF < 1.4 GHz, LDTSTOP\_L must not deassert less than 20 us after the processor broadcasts the STOP\_GRANT message.
  - If core power gating is enabled and the minimum time between power gating compute units is >= 5us and the link is operating at Gen 1 frequency then the minimum delay from STOP\_GRANT to LDTSTOP\_L deassertion must be increased. The condition when additional delay must be provided is

((D18F4x11[C:8][PwrGateEn] && (COUNT(D18F5x80[Enabled])>1) && (D18F5x128[PwrGateTmr]>=10b) && Gen1). The additional time required is: (COUNT(D18F5x80[Enabled])-1) \* (UNIT(D18F5x128[PwrGateTmr] us) - 1 us). This time requirement is in addition to any other time requirements specified in this section.

- If core power gating is enabled and the link is operating at Gen 1 frequency then the minimum delay from STOP\_GRANT to LDTSTOP\_L deassertion must be increased. The time requirements for the following 2 cases are in addition to any other time requirements specified in this section.
  - If (D18F4x11[C:8][PwrGateEn] && D18F5x128[CC6PwrDwnRegEn] && (D18F5x128[PllRegTime]>10b) && Gen1) then the additional time required is (COUNT(D18F5x80[Enabled])) \* (UNIT(D18F5x128[PllRegTime] us) - 1.5 us).
  - If (D18F4x11[C:8][PwrGateEn] && (D18F3xA0[PllLockTime]>001b) && Gen1) then the additional time required is (COUNT(D18F5x80[Enabled])) \* (UNIT(D18F3xA0[PllLockTime] us) - 2 us).
- The processor requires a minimum LDTSTOP\_L deassertion time as follows:
  - 3 us for unbuffered DIMMs and D18F2x90\_dct[1:0][DisDllShutdownSR]=1
  - 8 us for unbuffered DIMMs and D18F2x90\_dct[1:0][DisDllShutdownSR]=0.
  - 9 us for registered DIMMs.
- Narrow and slow links and use of D18F0x[E4,C4,A4,84][ExtCTL] can greatly increase the time for a Gen1 link to disconnect and reconnect, so the time between LDTSTOP\_L assertions must be increased appropriately as required by 8.3 of the link specification, titled “Disconnecting and Reconnecting HyperTransport™ Links”.
- LDTSTOP\_L may be asserted for the following reasons:
  - NB P-state transitions.
  - ACPI power state transitions controlled by D18F3x[84:80] (S4/S5, S3, S1, C1E, Link Init). See 2.6.1 [ACPI Power State Transitions].
  - In order to apply a change to a register field. This includes, but is not limited to:
    - Link width change. See D18F0x[E4,C4,A4,84][WidthOut, WidthIn].
    - Entry into ILM or BIST mode. See D18F0x[18C:170].
    - Link FIFO read pointer change. See D18F4x1[9C,94,8C,84]\_x[DF,CF].
- LDTSTOP\_L may not be asserted for the following reasons:
  - During AM3 0.2 GHz boot frequency.

## 2.12.8 Response Ordering

The processor supports non-standard response ordering, not required by the link specification. If the processor receives multiple IO-sourced memory read requests with certain attributes, then the processor ensures that the order of the responses to these requests is the same as the order in which the requests were received. The required attributes are:

- The requests have the same UnitID value (or logical UnitID if multiple UnitIDs are clumped; see D18F0x[11C,118,114,110] [Link Clumping Enable]).
- The requests have the same, non-zero SeqID value.
- The requests have the same PassPW bit value.
- The requests have the same Coherent (probe) bit value.
- The requests have the same RespPassPW bit value.
- The requests have the same Normal/Isochronous bit value.

This feature may allow IO devices to be designed that do not require re-order buffers. This behavior may be disabled through MSRC001\_001F [NB Configuration 1 (NB\_CFG1)][DisOrderRdRsp].

### 2.12.9 Link Testing, BIST, and ILM

The processor includes a link-defined BIST engine for each link. The control registers are found starting at [D18F4x1\[9C,94,8C,84\]\\_x100 \[Link BIST Control\]](#). See the link specification for more information.

The processor also supports link-defined internal loopback mode (ILM), controlled by [D18F0x\[18C:170\] \[Link Extended Control\]\[ILMEn\]](#).

### 2.12.10 Miscellaneous Behaviors and Requirements

- The processor does not support the link-defined Atomic read-modify-write command and returns target abort for any that are received.
- The processor does not support Device Messages and returns master abort for any that are received.
- The processor ignores the Chain bit.
- The processor checks for differential signaling on CTL[1:0] and disabled unused sublinks.
- Link width changes via LDTSTOP\_L assertion are only supported by BIOS when the system is quiesced. Link frequency may only be changed by BIOS with a warm reset.
- Link frequency changes from one Gen3 frequency to another are not allowed.
- The processor register space does not include the Gen3 link-defined UCC bit or CPIC bit. However, functionally, the initial revisions of the processor would have these bits set to indicate that unthrottled command generation from IO links is supported (i.e., setting LinkTrain[DisCmdThrt] on the other side of the link) and command packet insertion from IO links is supported (i.e., setting LinkTrain[CPIEn] on the other side of the link). However, no assurances are made regarding future processor revisions; they may rely on throttling and disabled command packet insertion to operate.
- While transmitting to an IO link, the processor does not ever insert commands (other than NOPs) into data packets and the processor supports throttling command generation based on the state of [D18F0x168\[DisNcHtCmdThrottle\]](#).
- The processor logically supports link-defined mode combinations as follows (however electrical requirements may limit some options):

**Table 112: Supported Link Operational Modes**

| Frequency              | 200-1000MHz | 1200MHz and higher                |                            |                  |
|------------------------|-------------|-----------------------------------|----------------------------|------------------|
| Coupling/<br>Link Type | DC          | DC<br>non-coherent<br>operational | DC coherent<br>operational | DC<br>test/debug |
| Termination            | RXDIFF      | RXDIFF                            | RXDIFF                     | RXDIFF           |
| Scrambling             | No          | Required                          | Required                   | Optional         |
| Gen3 Training          | No          | Yes                               | Yes                        | Yes              |
| Retry                  | No          | Required                          | Optional at low<br>speed   | Optional         |

- The processor supports link-defined INTx messages. It emulates the ORing of INTx assertions throughout the system and broadcasts the result. To accomplish this, the processor uses separate counters for each of the four interrupts (INTA, INTB, INTC, and INTD) which track INTx assertions and deassertions received by the coherent fabric. Each assertion causes the counter to increment and each deassertion causes the counter to decrement. As each counter transitions from 0 to 1, the interrupt assertion message is broadcast. As each counter transitions from 1 to 0, the interrupt deassertion message is broadcast.
- The processor reflects system management messages E2h to FFh for vendor-defined virtual wire messages. Devices that send or receive them must have programmable registers to control the command encodings used so that different devices can interoperate.

- Ganged links leave the upper sublink driven after cold reset (per InLnSt) unless the lower sublink is unconnected. If the lower sublink of a ganged link is unconnected, the entire link is disabled.
- The processor cannot be used in a system where the sideband signal (RESET\_L or LDTSTOP\_L) skew between devices is greater than 100 us.
- The processor only supports synchronous clocking mode, where both sides of the link have their clocks derived from the same oscillator.
- No ordering may be assumed between broadcast requests and posted writes.
- The processor allows reordering of upstream posted requests with PassPW=1.

#### 2.12.10.0.0.1 Legacy x87 FPU Stack Registers

.

### 2.13 RAS and Advanced Server Features

This section applies reliability, availability, and serviceability, or RAS, and related advanced server considerations.

#### 2.13.1 Machine Check Architecture

The processor contains logic and registers to control detection, corrective action, logging, and reporting of errors in the data or control paths in each core and the northbridge.

This section assumes familiarity with the *AMD64 Architecture Programmer's Manual Volume 2: System Programming* chapter titled “Machine Check Mechanism”. See [1.2 \[Reference Documents\]](#).

The ability of hardware to generate a machine check exception upon an error is indicated by [CPUID Fn0000\\_0001\\_EDX\[MCE\]](#).

##### 2.13.1.1 Machine Check Registers

[CPUID Fn0000\\_0001\\_EDX\[MCA\]](#) indicates the presence of the following machine check registers:

- [MSR0000\\_0179 \[Global Machine Check Capabilities \(MCG\\_CAP\)\]](#)
  - Reports how many machine check register banks are supported.
- [MSR0000\\_017A \[Global Machine Check Status \(MCG\\_STAT\)\]](#)
- [MSR0000\\_017B \[Global Machine Check Exception Reporting Control \(MCG\\_CTL\)\]](#)

The error reporting register banks supported are:

- **MC0**: load-store unit (LS), including data cache.
- **MC1**: instruction fetch unit (IF), including instruction cache.
- **MC2**: combined unit (CU), including L2 cache.
- **MC3**: Reserved.
- **MC4**: northbridge (NB), including L3 cache and IO links. These MSRs are also accessible from configuration space. There is only one NB error reporting bank, independent of the number of cores.
- **MC5**: execution unit (EX), including mapper/scheduler/retire/execute functions and fixed-issue reorder buffer.
- **MC6**: floating point unit (FP).

The register types within each bank are:

- **MCi\_CTL**: The Machine Check Control Register: Enables error reporting.
- **MCi\_STATUS**: The Machine Check Status Register: Logs information associated with errors.
- **MCi\_ADDR**: The Machine Check Address Register: Logs address information associated with errors.
- **MCi\_MISC**: The Machine Check Miscellaneous Register: Log miscellaneous information associated

with errors, as defined by each error type.

- **MCi\_CTL\_MASK**: The Machine Check Control Mask Register: Inhibit detection of an error source, unless otherwise specified.

Table 113 identifies the registers associated with each register bank:

**Table 113: MCA Register Cross-Reference Table**

| Register Bank | MCA Register |              |              |  |              |
|---------------|--------------|--------------|--------------|--|--------------|
|               | CTL          | STATUS       | ADDR         | MISC   | CTL_MASK     |
| MC0           | MSR0000_0400 | MSR0000_0401 | MSR0000_0402 | MSR0000_0403                                 | MSRC001_0044 |
| MC1           | MSR0000_0404 | MSR0000_0405 | MSR0000_0406 | MSR0000_0407                                 | MSRC001_0045 |
| MC2           | MSR0000_0408 | MSR0000_0409 | MSR0000_040A | MSR0000_040B                                 | MSRC001_0046 |
| MC3           | MSR0000_040C | MSR0000_040D | MSR0000_040E | MSR0000_040F                                 | MSRC001_0047 |
| MC4           | MSR0000_0410 | MSR0000_0411 | MSR0000_0412 | MSR0000_0413<br>MSRC000_0408<br>MSRC000_0409 | MSRC001_0048 |
| MC5           | MSR0000_0414 | MSR0000_0415 | MSR0000_0416 | MSR0000_0417                                 | MSRC001_0049 |
| MC6           | MSR0000_0418 | MSR0000_0419 | MSR0000_041A | MSR0000_041B                                 | MSRC001_004A |

Each register bank implements a minimum of 1 and a maximum of 9 machine check miscellaneous registers. A value of zero in MCi\_MISC0[BlkPtr] indicates that only one machine check miscellaneous register has been implemented for a given bank. If additional MISC registers beyond the first one are implemented for a given bank, a non-zero value in MCi\_MISC0[BlkPtr] points to the contiguous block of additional registers. The miscellaneous registers are denoted as MCi\_MISCj, where j represents the number of miscellaneous registers for that bank.

The presence of valid information in the first MISC register in the bank (MCi\_MISC0) is indicated by MCi\_STATUS[MiscV]. The presence of valid information in additional implemented MISC registers is indicated by MCi\_MISCj[Val] in the target register.

### 2.13.1.2 Machine Check Errors Classes

The classes of machine check errors are:

- Uncorrectable
- Deferred
- Correctable

Uncorrectable errors cannot be corrected by hardware and may cause loss of data, corruption of processor state, or both. Uncorrectable errors update the status and address registers if not masked from logging in MCi\_CTL\_MASK. Information in the status and address registers from a previously logged deferred or correctable error is overwritten. Uncorrectable errors that are enabled in MCi\_CTL result in reporting to software via machine check exceptions. If an uncorrectable error is masked from logging, the error is ignored by hardware (exceptions are noted in the register definitions). If an uncorrectable error is disabled from reporting, containment of the error and logging/reporting of subsequent errors may be affected. Therefore, enable reporting of unmasked uncorrectable errors for normal operation. Disable reporting of uncorrectable errors only for debug purposes.

Deferred errors are errors that cannot be corrected by hardware, but do not cause an immediate interruption in program flow, loss of data integrity, or corruption of processor state. These errors indicate that data has been

corrupted but not consumed; no exception is generated because the data has not been referenced by a core or an IO link. Hardware writes information to the status and address registers in the corresponding bank that identifies the source of the error if deferred errors are enabled for logging. If there is information in the status and address registers from a previously logged correctable error, it is overwritten. Previously logged deferred or uncorrectable errors are not overwritten. Deferred errors are not reported via machine check exceptions; they can be seen by polling the MCI\_STATUS registers. Refer to section 2.13.1.10 [Deferred Errors and Data Poisoning] for more detail on deferred errors.

Correctable errors are those which have been corrected by hardware and cause no loss of data or corruption of processor state (unless disabled by implementation-specific bits in the control registers for test or debug reasons). Hardware writes the status and address registers in the corresponding register bank with information that identifies the source of the error if they are enabled for logging. Correctable errors are not reported via machine check exceptions; some correctable errors may be reported to software via error thresholding (see 2.13.1.7 [Error Thresholding]).

The implications of these categories of errors are:

1. Uncorrected error; hardware did not deal with the problem.
  - Operationally (error handling), action required, because program flow is affected.
  - Diagnostically (fault management), software may collect information to determine if any components should be de-configured or serviced.
  - Examples include:
    - Uncorrectable ECC, no way to avoid passing it to process.
    - Poisoned data consumed (as opposed to created), no way to avoid passing it to process or link.
2. Deferred error; hardware partially dealt with the problem via containment.
  - Operationally, action optional, because program flow has not been affected. However, steps may be taken by software to prevent access to the data in error.
  - Diagnostically, software may collect information to determine if any components should be de-configured or serviced.
  - Examples include:
    - Uncorrectable ECC, converted to poison data.
3. Corrected error; hardware dealt with the problem.
  - Operationally, no action required, because program flow is unaffected.
  - Diagnostically, software may collect information to determine if any components should be de-configured or serviced.
  - Examples include:
    - Correctable ECC, corrected in-line.

For debug observability, D18F3x180[ChgUcToCeEn] can be used to convert NB uncorrectable errors to correctable errors.

Machine check conditions can be simulated by using MSRC001\_0015[McStatusWrEn]. This is useful for debugging machine check handlers. See 2.13.3 [Error Injection and Simulation] for more detail.

### 2.13.1.3 Error Detection, Action, Logging, and Reporting

Error detection is controlled by the MASK registers:

- Error detection for MCA controlled errors is enabled if not masked by MCI\_CTL\_MASK (see Table 113).
- Error masking is performed regardless of MCA bank enablement in MCG\_CTL (MSR0000\_017B).

Error action refers to the hardware response to an error, aside from logging and reporting. Enablement of error action for each error is enumerated in the EAC (Error Action Condition) column of the error descriptions tables as follows:

- D: Detected. The error action is taken if the error is detected (i.e., not masked). These actions occur regardless of whether the MCA bank is enabled in MCG\_CTL.
- E: Enabled. The error action is taken if the error is detected and the bank is enabled in MCG\_CTL.

Error logging refers to the storing of information in the status registers, and is enabled if all of the following are true:

- Error detection is enabled.
- The MCA bank is enabled in MCG\_CTL.

Error reporting refers to active notification of errors to software via machine check exceptions, and is enabled if all of the following are true:

- Error logging is enabled.
- The corresponding enable bit for the error in MCi\_CTL is set to 1.

A machine check exception will be generated if all the following are true:

- The error is uncorrectable.
- The error is enabled for reporting.
- CR4.MCE is enabled.

Notes:

1. If CR4.MCE is clear, an error configured to cause a machine check exception will cause a shutdown.
2. If error reporting is disabled, the setting of CR4.MCE has no effect.
3. If an uncorrectable error is disabled from reporting, containment of the error and logging/reporting of subsequent errors may be affected. Therefore, unmasked uncorrectable errors should be enabled for reporting for normal operation. Uncorrectable errors should only be disabled from reporting for debug purposes.
4. Errors not associated with a specific core are reflected to core 0 of the compute unit. The error description tables identify which errors are associated or not associated with a specific core of the compute unit.

Throughout the MCA register descriptions, the terms “enabled” and “disabled” generally refer to reporting, and the terms “masked” and “unmasked” generally refer to logging, unless otherwise noted.

Some logged errors increment a counter in MCi\_MISC, which may trigger an interrupt (see [2.13.1.7 \[Error Thresholding\]](#)). Although no machine check exception will be generated, these notifications can be viewed as “correctable machine check interrupts”.

### 2.13.1.3.1 MCA conditions that cause Shutdown

The following architectural conditions cause the processor to enter the Shutdown state; see “Machine-Check Errors” and subsections in APM volume 2 for more detail; see [1.2 \[Reference Documents\]](#):

- Attempting to generate an MCE when machine check reporting is disabled at the system level (CR4.MCE=0).
- Attempting to generate an MCE when a machine check is in progress on the same core (MSR0000\_017A[MCIP]=1).

The following non-architectural conditions cause the processor to enter the Shutdown state:

- EX “Retire dispatch queue parity” error. See [Table 283 \[EX Error Descriptions\]](#).
- EX “Mapper checkpoint array parity” error if UC=1. See [Table 283 \[EX Error Descriptions\]](#).

### 2.13.1.3.2 Error Logging During Overflow

An error to be logged when the status register contains valid data can result in an overflow condition. During error overflow conditions, the new error may not be logged or an error which has already been logged in the status register may be overwritten. For the rules on error overflow, priority, and overwriting, see [MSR0000\\_0401\[Overflow\]](#) and [MSR0000\\_0411\[Overflow\]](#).

Overflow alone does not indicate a shutdown condition. Uncorrectable errors require software intervention. Therefore, when an uncorrectable error cannot be logged, critical error information may have been lost, and MCi\_STATUS[PCC] may be set. If PCC is indicated, software should terminate system processing to prevent data corruption (see [2.13.1.6 \[Handling Machine Check Exceptions\]](#)). If PCC is not indicated, any MCA data lost due to overflow was informational only and not critical to system hardware operation.

[Table 114](#) indicates which errors are overwritten in the error status registers.

**Table 114: Overwrite Priorities for All Banks**

|             |               |          | Older Error   |          |           |           |             |           |
|-------------|---------------|----------|---------------|----------|-----------|-----------|-------------|-----------|
|             |               |          | Uncorrectable |          | Deferred  |           | Correctable |           |
|             |               |          | Enabled       | Disabled | Enabled   | Disabled  | Enabled     | Disabled  |
| Newer Error | Uncorrectable | Enabled  | -             | -        | Overwrite | Overwrite | Overwrite   | Overwrite |
|             |               | Disabled | -             | -        | Overwrite | Overwrite | Overwrite   | Overwrite |
|             | Deferred      | Enabled  | -             | -        | -         | -         | Overwrite   | Overwrite |
|             |               | Disabled | -             | -        | -         | -         | Overwrite   | Overwrite |
|             | Correctable   | Enabled  | -             | -        | -         | -         | -           | -         |
|             |               | Disabled | -             | -        | -         | -         | -           | -         |

### 2.13.1.4 MCA Initialization

The following initialization sequence must be followed:

- MCi\_CTL\_MASK registers ([MSRC001\\_0044](#) to [MSRC001\\_004A](#)):
  - BIOS must initialize the mask registers to inhibit error detection prior to the initialization of MCi\_CTL and [MSR0000\\_017B](#).
  - BIOS must not clear MASK bits that are reset to 1.
- The MCi\_CTL registers must be initialized by the operating system prior to enabling the error reporting banks in MCG\_CTL.

If initializing after a cold reset (see [D18F0x6C\[ColdRstDet\]](#)), then BIOS must clear the MCi\_STATUS MSRs (see [Table 113](#)). If initializing after a warm reset, then BIOS should check for valid MCA errors and if present save the status for later use (see [2.13.1.6 \[Handling Machine Check Exceptions\]](#)).

BIOS may initialize the MCA without setting CR4.MCE; this will result in a system shutdown on any machine check which would have caused a machine check exception (followed by a reboot if configured in the chipset). Alternatively, BIOS that wishes to ensure continued operation in the event that a machine check occurs during boot may write MCG\_CTL with all ones and write zeros into each MCi\_CTL. With these settings, a machine check error will result in MCi\_STATUS being written without generating a machine check exception or a system shutdown. BIOS may then poll MCi\_STATUS during critical sections of boot to ensure system integrity. Before passing control to the operating system, BIOS should restore the values of those registers to what the operating system is expecting. (Note that using MCi\_CTL to disable error reporting on uncorrectable errors

will affect error containment; see [2.13.1.3 \[Error Detection, Action, Logging, and Reporting\]](#).)

Before ECC memory has been initialized with valid ECC check bits, BIOS must ensure that no memory operations are initiated if MCA reporting is enabled. This includes memory operations that may be initiated by hardware prefetching or other speculative execution. It is recommended that, until all of memory has been initialized with valid ECC check bits, the BIOS either does not have any valid MTRRs specifying a DRAM memory type or does not enable DRAM ECC machine check exceptions.

### 2.13.1.5 Error Code

The MCi\_STATUS[ErrorCode] field contains information on the logged error. [Table 115 \[Error Code Types\]](#) identifies how to decode ErrorCode. The MCi\_STATUS[ErrorCodeExt] field contains detailed, model-specific information that is used for error diagnosis but not error handling; see [2.13.1.6 \[Handling Machine Check Exceptions\]](#).

For a given error reporting bank, Error Code is used in conjunction with other MCi\_STATUS fields to identify the Error Type. Details for each Error Type are described in the error signatures tables accompanying the MCi\_STATUS register for each bank:

- MC0; [Table 265](#).
- MC1; [Table 268](#).
- MC2; [Table 272](#).
- MC3; Reserved.
- MC4; [Table 275](#) and [Table 276](#).
- MC5; [Table 284](#).
- MC6; [Table 287](#).

**Table 115: Error Code Types**

| Error Code          | Error Code Type | Description  |
|---------------------|-----------------|--|
| 0000_0000_0001_TTLL | TLB             | Errors in the GART TLB cache.<br>TT = Transaction Type<br>LL = Cache Level   |

| 11        | GEN: Generic        |

### 2.13.1.6 Handling Machine Check Exceptions

A machine check handler is invoked to handle an exception for a particular core. Because MCA registers are generally not shared among cores, the handler does not need to coordinate register usage with handler instances on other cores. (Those few MCA registers which are shared are noted in the register description. See also [2.4.1.1 \[Registers Shared by Cores in a Compute Unit\]](#).) For access to the NB MCA registers, [D18F3x44\[NbMcaToMstCpuEn\]](#) allows a single core (the NBC) to access the registers through MSR space without contention from other cores. This organization of registers on a per core basis allows independent execution, simplifies exception handling, and reduces the number of conditions which are globally fatal.

At a minimum, the machine check handler must be capable of logging error information for later examination. The handler should log as much information as is needed to diagnose the error.

More thorough exception handler implementations can analyze errors to determine if each error is recoverable by software. If a recoverable error is identified, the exception handler can attempt to correct the error and restart the interrupted program. An error may not be recoverable for the process or virtual machine it directly affects, but may be containable, so that other processes or virtual machines in the system are unaffected and system operation is recovered; see [2.13.1.6.1 \[MCA Differentiation Between System-Fatal and Process-Fatal Errors\]](#).

Machine check exception handlers that attempt to recover must be thorough in their analysis and the corrective actions they take. The following guidelines should be used when writing such a handler:

- Data collection:
  - All status registers in all error reporting banks must be examined to identify the cause of the machine check exception.
    - Read [MSR0000\\_0179\[Count\]](#) to determine the number of status registers visible to the core. The status registers are numbered from 0 to one less than the value found in [MSR0000\\_0179\[Count\]](#). For example, if the Count field indicates five status registers are supported, they are numbered MC0\_STATUS to MC4\_STATUS. These are generically referred to as MCi\_STATUS.
    - Check the valid bit in each status register (MCi\_STATUS[Val]). The remainder of the status register should be examined only when its valid bit is set.
    - When identifying the error condition and determining how to handle the error, portable exception handlers should examine the following MCi\_STATUS fields: ErrorCode, UC, PCC, CECC, UECC, Deferred, Poison. The expected settings of these and other fields in MCi\_STATUS are identified in the error signatures tables which accompany the descriptions of each MCA status register. See [2.13.1.5 \[Error Code\]](#) for a discussion of error codes and pointers to the error signatures tables.
      - MCi\_STATUS[ErrorCodeExt] should generally not be used by portable code to identify the error condition because it is model specific. ErrorCodeExt is useful in determining the error subtype for root cause analysis.
    - Error handlers should collect all available MCA information (status register, address register, miscellaneous register, etc.), but should only interrogate details to the level which affects their actions. Lower level details may be useful for diagnosis and root cause analysis, but not for error handling.
- Recovery:
  - Check the valid MCi\_STATUS registers to see if error recovery is possible.
    - Error recovery is not possible when the processor context corrupt indicator (MCi\_STATUS[PCC]) is set to 1.
      - The error overflow status indicator (MCi\_STATUS[Overflow]) does not indicate whether error recovery is possible. See [2.13.1.3.2 \[Error Logging During Overflow\]](#).
    - If error recovery is not possible, the handler should log the error information and return to the operating system for system termination.

- Check `MCi_STATUS[UC]` to see if the processor corrected the error. If UC is set, the processor did not correct the error, and the exception handler must correct the error prior to attempting to restart the interrupted program. If the handler cannot correct the error, it should log the error information and return to the operating system. If the error affects only process data, it may be possible to terminate only the affected process or virtual machine. If the error affects processor state, continued use of that processor should not occur. See individual error descriptions for further guidance.
- If `MSR0000_017A[RIPV]` is set, the interrupted program can be restarted reliably at the instruction pointer address pushed onto the exception handler stack if any uncorrectable error has been corrected by software. If RIPV is clear, the interrupted program cannot be restarted reliably, although it may be possible to restart it for debugging purposes. As long as PCC is clear, it may be possible to terminate only the affected process or virtual machine.
- When logging errors, particularly those that are not recoverable, check `MSR0000_017A[EIPV]` to see if the instruction pointer address pushed onto the exception handler stack is related to the machine check. If EIPV is clear, the address is not ensured to be related to the error.
- See 2.13.1.6.1 [MCA Differentiation Between System-Fatal and Process-Fatal Errors] for more explanation on the relationship between PCC, RIPV, and EIPV.
- Exit:
  - When an exception handler is able to successfully log an error condition, clear the `MCi_STATUS` registers prior to exiting the machine check handler.
  - Prior to exiting the machine check handler, be sure to clear `MSR0000_017A[MCIP]`. MCIP indicates that a machine check exception is in progress. If this bit is set when another machine check exception occurs in the same core, the processor enters the shutdown state.

Additional machine check handler portability can be added by having the handler use the `CPUID` instruction to identify the processor and its capabilities. Implementation specific software can be added to the machine check exception handler based on the processor information reported by `CPUID`.

In cases where sync flood is the recommended response to a particular error, a machine check exception cannot be used in lieu of the sync flood to stop the propagation of potentially bad data.

#### 2.13.1.6.1 MCA Differentiation Between System-Fatal and Process-Fatal Errors

Software may use MCA status to determine the scope errors and the recoverability of the system. The bits `MCi_STATUS[PCC]`, `MSR0000_017A[RIPV]`, and `MSR0000_017A[EIPV]` form a hierarchy. Table 121 shows how these bits are interpreted.

**Table 121: Error Scope Hierarchy**

| PCC | UC | RIPV | EIPV | Deferred | Poison | Comments  |
|-----|----|------|------|----------|--------|---|
| 1   | 1  | -    | -    | -        | -      | <b>System fatal error.</b> Signaled via machine check exception, action required. Error has corrupted system state (PCC=1). The error is fatal to the system and the system processing must be terminated.  |
| 0   | 1  | 1    | 1    | -        | -      | <b>Hardware uncorrectable, software restartable error.</b> Signaled via machine check exception, action required. The error is confined to the process (PCC=0), and the process program can be restarted (RIPV=1) if the uncorrectable error is corrected by software.  |
| 0   | 1  | 0    | -    | -        | 0/1    | <b>Hardware uncorrectable, software containable error.</b> Signaled via machine check exception, action required. The error is confined to the process, however the process cannot be restarted even if the uncorrectable error is corrected by software.<br><br>Poison=1; the error is due to consumption of poison data. If the affected process or virtual machine is terminated, the system may continue operation.           |
| 0   | 0  | -    | -    | 1        | 0      | <b>Deferred error.</b> Action optional. A latent error has been discovered, but not yet consumed; a machine check exception will be generated if the affected data is consumed. Error handling software may attempt to correct this data error, or prevent access by processes which map the data, or make the physical resource containing the data inaccessible.<br>Note: May be detected on a demand access or a scrub access. |
| 0   | 0  | -    | -    | 0        | 0      | <b>Correctable error.</b> Signaled via error thresholding mechanisms (2.13.1.7 [Error Thresholding]); no action required.   |

### 2.13.1.7 Error Thresholding

For some types of errors, the hardware maintains counts of the number of errors. When the counter reaches a programmable threshold, an event may optionally be triggered to signal software. This is known as error thresholding. The primary purpose of error thresholding is to help software recognize an excessive rate of errors, which may indicate marginal or failing hardware. This information can be used to make decisions about deconfiguring hardware or scheduling service actions. Counts are incremented for correctable, deferred, and uncorrectable errors.

The error thresholding hardware counts only the number of errors; it is up to software to track the errors reported over time in order to determine the rate of errors. Thresholding gives error counts on groups of resources. In order to make decisions on individual resources, a finer granularity of error information, such as MCA information for specific errors, must be utilized in order to obtain more accurate counts and to limit the scope of actions to affected hardware.

Thresholding is performed for “Error Threshold Groups” identified in the list below. For all error threshold groups, some number of correctable errors is expected and normal. There are numerous factors influencing error rates, including temperature, voltage, operating speed, and geographic location. In order to accommodate the various factors, including software latency to respond and track the error thresholding, additional guard-band above the normal rates is recommended before error rates are considered abnormal for purposes of hardware action.

The {MC0, MC1, MC2, MC5} error thresholding banks maintains counters, but do not provide interrupts when the threshold is reached; these counters must be polled.

Error thresholding groups:

- LS (MC0)
  - LS errors are counted and polled via [MSR0000\\_0403](#).
  - LS errors are listed in [Table 265 \[LS Error Signatures\]](#).
- IF (MC1)
  - IF errors are counted and polled via [MSR0000\\_0407](#).
  - IF errors are listed in [Table 268 \[IF Error Signatures\]](#).
- CU (MC2)
  - CU errors are counted and polled via [MSR0000\\_040B](#).
  - CU errors are listed in [Table 272 \[CU Error Signatures\]](#).
- DRAM (MC4)
  - Memory errors are counted and polled or reported via [MSR0000\\_0413](#).
  - DRAM errors are the errors listed in [Table 274 \[NB Error Descriptions\]](#) as “D” (DRAM) in the ETG (Error Threshold Group) column.
  - Operating systems can avoid or stop using memory pages with excessive errors.
  - Spare memory can dynamically replace memory with excessive errors. See [2.10.9 \[On-Line Spare\]](#).
- Links (MC4)
  - Link errors are counted and polled or reported via [MSRC000\\_0408](#).
  - Link errors are the errors listed in [Table 274 \[NB Error Descriptions\]](#) as “L” (Cache) in the ETG (Error Threshold Group) column.
  - For a link exhibiting excessive errors, it may be possible to reduce errors by lowering the link frequency or reducing the link width (if a bad lane can be avoided). See [2.12 \[Links\]](#) for details and restrictions on configuring links.
- L3 cache (MC4)
  - L3 cache errors are counted and polled or reported via [MSRC000\\_0409](#).
  - L3 cache errors are the errors listed in [Table 274 \[NB Error Descriptions\]](#) as “C” (Cache) in the ETG (Error Threshold Group) column.
  - If the product does not include an L3 cache, per [CPUID Fn8000\\_0006\\_EDX \[L3 Cache Identifiers\]](#), then the Valid and CntP bits are both 0 and the register logs no information.
- EX (MC5)
  - EX errors are counted and polled via [MSR0000\\_0417](#).
  - EX errors are listed in [Table 284 \[EX Error Signatures\]](#).

In rare circumstances, such as two simultaneous errors in the same error thresholding group, it is possible for one error not to increment the counter. In these conditions, [MCi\\_STATUS\[Overflow\]](#) may indicate that an overflow occurred, but the error counter may only indicate one error.

### 2.13.1.8 Scrub Rate Considerations

This section gives guidelines for the scrub rate settings available in [D18F3x58 \[Scrub Rate Control\]](#). Scrubbers are used to periodically read cacheline sized data locations and associated tags. There are two primary benefits

to scrubbing. First, scrubbing corrects any correctable errors which are discovered before they can migrate into uncorrectable errors. This is particularly important for soft errors, which are caused by external sources such as radiation and which are temporary conditions which do not indicate malfunctioning hardware. Second, scrubbers help identify marginal or failed hardware by finding and logging repeated errors at the same locations (see also 2.13.1.7 [Error Thresholding]).

There are many factors which influence scrub rates. Among these are:

- The size of memory or cache to be scrubbed
- Resistance to upsets
- Geographic location and altitude
- Alpha particle contribution of packaging
- Performance sensitivity
- Risk aversion

The baseline recommendations in Table 122 are intended to provide excellent protection at most geographic locations, while having no measurable effect on performance. Adjustments may be necessary due to special circumstances. Refer to JEDEC standards for guidelines on adjusting for geographic location.

**Table 122: Recommended Scrub Rates per Node**

| Register            | Memory Size per Node (GB) | Register Setting | Scrub Rate |
|---------------------|---------------------------|------------------|------------|
| D18F3x58[L3Scrub]   | -                         | 10h              | 1.31 ms    |
| D18F3x58[DramScrub] | 0 GB == Size              | 00h              | Disabled   |
|                     | 0 GB < Size <= 1 GB       | 12h              | 5.24 ms    |
|                     | 1 GB < Size <= 2 GB       | 11h              | 2.62 ms    |
|                     | 2 GB < Size <= 4 GB       | 10h              | 1.31 ms    |
|                     | 4 GB < Size <= 8 GB       | 0Fh              | 655.4 us   |
|                     | 8 GB < Size <= 16 GB      | 0Eh              | 327.7 us   |
|                     | 16 GB < Size <= 32 GB     | 0Dh              | 163.8 us   |
|                     | 32 GB < Size <= 64 GB     | 0Ch              | 81.9 us    |
|                     | 64 GB < Size <= 128 GB    | 0Bh              | 41.0 us    |
|                     | 128 GB < Size <= 256 GB   | 0Ah              | 20.5 us    |
|                     | 256 GB < Size             | 09h              | 10.2 us    |

For steady state operation, finding a range of useful scrub rates may be performed by selecting a scrub rate which is high enough to give good confidence about protection from accumulating errors and low enough that it has no measurable effect on performance. The above baselines are made to maximize error coverage without affecting performance and not based on specific processor soft error rates.

For low power states in which the processor core is halted, the power management configuration may affect scrubbing; see 2.9.5 [Memory Scrubbers].

### 2.13.1.9 Error Diagnosis

This section describes generalized information and algorithms for diagnosing errors. The primary goal of diagnosis is to identify the failing component for repair purposes. The secondary goal is to identify the smallest possible sub-component for de-allocation, de-configuration, or design/manufacturing root cause analysis.

*Indictment* means identifying the part in error. The simplest form of indictment is *self-indictment*, where the bank reporting the error is also the unit in error. The next simplest form of indictment is *eyewitness indictment*, where the part in error is not the bank reporting the error, but is identified unambiguously. Both of these forms can be considered direct indictment; the information for indictment is contained in the MCA error information. If an error is not directly indicted, then identifying the part in error is more difficult and may not be an explicit part of the error log.

In general, an address logged in the MCA is useful for direct indictment only if the address identifies a physical location in error, such as a DRAM address or a cache index. Logical addresses, while identifying the data, do not identify the location of the data.

If possible, physical storage locations in DRAM or in caches should be checked to determine whether the error is a soft error (a temporary upset of the stored value) or a hard fault (malfunctioning hardware). A location which has had a soft error can be corrected by writing a new value to the location; a reread of the location should see the new value. Hard faults cannot be corrected by writing a new value; the hardware persistently returns the previous value. If such checking is not possible, a grossly simplifying assumption can be made that uncorrectable errors are hard and correctable errors are soft. Repeated correctable errors from the same location are an indication that the fault is actually hard.

### 2.13.1.9.1 Common Diagnosis Information

A common set of diagnosis information is useful for many problems. [Table 123](#) indicates the minimum set of generally useful diagnostic information that should be collected by software, unless the specifics of the problem are known to be narrower, based on the error code or other information.

It is useful to collect configuration information to ensure that the behavior is not caused by misconfiguration.

**Table 123: Registers Commonly Used for Diagnosis**

| MCA Bank | Status                                       | Configuration                                |
|----------|--|--|
| MC0      | MSR0000_0401<br>MSR0000_0402<br>MSR0000_0403 | MSR0000_0400<br>MSRC001_1022<br>MSRC001_0044 |
| MC1      | MSR0000_0405<br>MSR0000_0406<br>MSR0000_0407 | MSR0000_0404<br>MSRC001_0045                 |
| MC2      | MSR0000_0409<br>MSR0000_040A<br>MSR0000_040B | MSR0000_0408<br>MSRC001_0046<br>MSRC001_1023 |
| MC3      | Reserved                                     | Reserved                                     |

**Table 123: Registers Commonly Used for Diagnosis**

| MCA Bank | Status   | Configuration   |
|----------|--|---|
| MC4      | MSR0000_0411<br>MSR0000_0412<br>MSR0000_0413<br>MSRC000_0408<br>MSRC000_0409<br>D18F3x54<br>D18F3x58<br>D18F2xAC | MSR0000_0410<br>MSRC001_0048<br>D18F3x40<br>D18F3x44<br>D18F3xE4<br>D18F3xE8<br>MSRC001_001F<br>D18F3x180 |
| MC5      | MSR0000_0415<br>MSR0000_0416<br>MSR0000_0417   | MSR0000_0414<br>MSRC001_0049  |
| MC6      | MSR0000_0419<br>MSR0000_041A<br>MSR0000_041B   | MSR0000_0418<br>MSRC001_004A  |

If examining MCA registers after startup, determine the cause of the startup:

- INIT; [D18F0x6C](#)[InitDet].
- Cold reset; [D18F0x6C](#)[ColdRstDet].
- Warm reset; if not INIT or cold reset.

To see if a link failure occurred, examine [D18F0x\[E4,C4,A4,84\]](#)[LinkFail]. If set, look for additional information:

- Receipt of a sync, such as during a sync flood, saves a status of Sync Error in MC4\_STATUS.
- CRC error saves a status of CRC Error in MC4\_STATUS. See [D18F0x\[E4,C4,A4,84\]](#)[CrcErr and CrcFloodEn].
- Link not present does not save status in MC4\_STATUS. See [D18F0x\[E4,C4,A4,84\]](#)[InitComplete].

Other registers may be needed depending on the specific error symptoms.

### 2.13.1.10 Deferred Errors and Data Poisoning

Deferred errors indicate error conditions which could not be corrected, but which require no action (i.e., action optional). Data poisoning marks data which has encountered an uncorrectable error, so that it can be tracked until it is consumed or discarded. Together, data poisoning and deferred errors provide an infrastructure for reducing the severity of errors and the number of system outages for some classes of errors.

Processor cores create poison data and deferred errors as identified in the Error Signatures tables. When poison data or data with an uncorrectable ECC error is consumed, a machine check exception for an uncorrected error is signaled (MCi\_STATUS[UC]). If the data is poison, MCi\_STATUS[Poison] is also set. The NB converts any poison data sent from the core to a machine check exception with error type Compute Unit Data Error. To understand the cause of a machine check exception due to Compute Unit Data Error, examine the core MCA status registers for deferred errors.

The deferred error is logged in the MCA registers for diagnostic purposes at the time the error is discovered and the data is poisoned. This deferred error can help identify the source of the error. The deferred error is

logged independently of any associated poison data machine check. For example, it is possible for a cache eviction to result in a deferred error associated with the cache, and a corresponding machine check exception from the NB which receives the data.

### 2.13.1.10.1 Software Error Handling

General software error handling for machine check exceptions is described in [2.13.1.6 \[Handling Machine Check Exceptions\]](#). Specific considerations for deferred errors are described here.

A deferred error is logged on the processor which detected the underlying error condition. The deferred error is primarily used for collecting diagnostic information on the cause of the error. When performing diagnosis due to deferred errors and poison data, it is important to distinguish between the physical address of the data in error and the physical location which caused the error. Physical address is used for tracking data usage. Physical location is important for determining the hardware in error.

### 2.13.2 DRAM Considerations for ECC

DRAM is protected against errors by an error correcting code (ECC). There are two different error correcting codes supported by the memory controller. Both DRAM error correcting codes are 128/16 (data bits/check bits) BCH codes. The primary difference between them is the symbol size; one code uses 8-bit symbols, and the other uses 4-bit symbols. A symbol is a group of bits which are symbol-size aligned; the x8 code uses 8-bit symbols which are 8-bit aligned, and the x4 code uses 4-bit symbols which are 4-bit aligned. For the x8 code, bits 0–7 make symbol 0, bits 8–15 make symbol 1, and so on. For the x4 code, bits 0–3 make symbol 0, bits 4–7 make symbol 1, and so on. Both x4 and x8 codes are available, and one must be selected during configuration by setting [D18F3x180\[EccSymbolSize\]](#).

A single symbol error is any bit error combination within one symbol. Both of these ECC codes are able to detect and correct any number of incorrect bits in a single symbol. The x4 code is able to detect 100% of errors in two symbols. The x8 code in conjunction with an automatic, hardware managed, history-based scheme is able to detect 99.9999963% of errors in two symbols.

ECC has different characteristics depending on the physical configuration of the memory, including DRAM device width and multi-beat interleaving.

- DRAM device width refers to the number of bits sourced simultaneously from a single memory chip. For example, a x4 DRAM device provides 4 bits in a single beat.
- Multi-beat interleaving refers to the way bits from the different memory beats are organized to form an ECC line. See [2.13.2.1 \[Multi-Beat Interleaving\]](#).

In certain configurations, the ECC provides “chipkill” functionality; all single symbol errors caused by a failed DRAM device are corrected. Chipkill recovery is only possible when indicated by [D18F3x44\[ChipKillEccCap\]](#) and the symbol size is greater than the DRAM device width. When a DRAM device fails, the code is able to correct the entire lost symbol, as long as there are no other symbols with errors. In cases where the symbol size is smaller than or equal to the DRAM device width, DRAM device failures result in multiple symbol errors, and cannot be corrected.

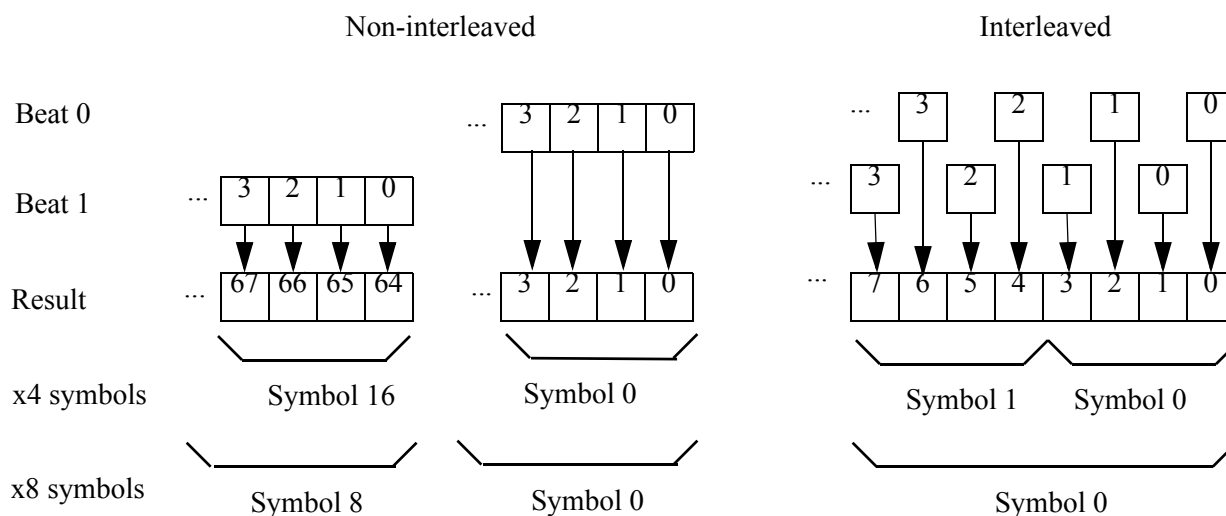

For configuration specific recommendations and detection and correction characteristics see [Table 124](#) below.

**Table 124: Configuration Specific Recommended ECC Symbol Size**

| Recom-<br>mended<br>Symbol<br>Size <sup>1</sup>   | DRAM<br>Width <sup>2</sup> | Error Description  |
|---|----------------------------|--|
| x8  | x4                         | The failure of a DRAM device results in errors to one symbol, and can be corrected (chipkill).   |
| x8  | x8 or greater              | The failure of a DRAM device results in errors to multiple symbols, and can be detected with a high probability but cannot be corrected. These configurations are not recommended for high reliability or high availability systems, due to the higher potential for uncorrected, undetected, or mis-corrected errors. |
| 1. See <a href="#">D18F3x180[EccSymbolSize]</a> .<br>2. See <a href="#">DeviceWidth</a> . |                            |  |

### 2.13.2.1 Multi-Beat Interleaving

The DCT requires two beats of 64-bit wide DRAM data from the same DRAM devices to form the 128-bit wide data upon which to apply the ECC function. When specified by [D18F2x110\[DetDatIntLv\]](#), even and odd bits from the two 64-bit data beats can be interleaved to create the 128-bit line as shown in [Figure 17](#).

**Figure 17: Example of Line Interleaving from x4 DRAM Using x4 and x8 ECC**

When multi-beat interleaving is performed, a partially failing device (e.g., pin failure) contributes two incorrect bits to the same symbol, which can be corrected by the ECC. A totally failing DRAM device (i.e., chip failure) which is wide enough to contribute error bits to two different symbols results in an uncorrectable error.

When using the ECC syndrome to find the bits in error, see [Figure 17](#) to map from the symbol and bit number back to the correct device bit.

### 2.13.2.2 Software Managed Bad Symbol Identification

x8 ECC is augmented by a software managed algorithm to provide additional coverage against two symbol errors. Bad symbol identification is managed by software and used by hardware to improve detection of a second symbol in error in the same beat.

When software determines that a DRAM device is bad, it should program the rank and symbol into the BadDramCs and BadDramSymbol fields of the appropriate [D18F3x138 \[DCT0 Bad Symbol Identification\]](#) or [D18F3x13C \[DCT1 Bad Symbol Identification\]](#). The bad symbol is determined by using the syndrome captured during correctable errors, as described in section [2.13.2.3.1 \[x8 ECC\]](#). Determining that a device is bad can be performed using the guidelines in section [2.13.1.7 \[Error Thresholding\]](#).

The memory controller uses the bad symbol identification registers during fetches to determine if errors are correctable or uncorrectable. When the bad symbol identification register contains valid information:

- If a fetched line has an error only in the same rank and symbol identified by this register, then the error is a correctable chipkill error.
- If a fetched line has an error in the same rank and a different symbol than identified by this register, then there are at least two symbol errors in the line and the error is uncorrectable.

### 2.13.2.3 ECC Syndromes

For memory errors, the sections below describe how to find the DIMM in error. The process varies slightly according to the ECC code in use. To determine which ECC code is being used, see [D18F3x180\[EccSymbolSize\]](#).

For correctable errors, the DIMM in error is uniquely identified by the error address ([D18F3x54\[ErrAddr\]](#)) and the ECC syndrome ([D18F3x48\[Syndrome\[15:8\]\]](#) and [D18F3x4C\[Syndrome\[7:0\]\]](#)).

#### 2.13.2.3.1 x8 ECC

The use of x8 ECC is indicated in [D18F3x180\[EccSymbolSize\]](#).

The syndrome field uniquely identifies the failing bit positions of a correctable ECC error. Only syndromes identified in [Table 125](#) are correctable by the error correcting code.

Symbols 00h-07h map to data bits 0-63; symbols 08h-0Fh map to data bits 64-127; symbol 10h maps to special purpose non-data bits; symbols 11h-12h map to ECC check bits for data bits 0-127 and symbol 10h.

To use [Table 125](#), find the 16-bit syndrome value in the table. Because of the large size of the table, this is performed by taking the low order byte of the syndrome as the row number, then scanning the row for the complete 16-bit syndrome. If it is not found, use the high order byte of the syndrome as the row number, then scan the row for the complete 16-bit syndrome. Once the syndrome is found in the table, the corresponding Symbol In Error column indicates which symbol, and therefore which DIMM has the error. The Error Bitmask column indicates the bits in error in the symbol.

For example, assume the ECC syndrome is 03EAh. First search row EAh for the complete syndrome. Since it is not found, search row 03h for the complete syndrome. It is found in column 9h, so symbol 9h has the error. Since the error bitmask indicates value 3h (0011b), bits 0 and 1 within that symbol are corrupted. Symbol 9h maps to bits 72-79, so the corrupted bits are 72 and 73 of the line.

**Table 125: x8 ECC Correctable Syndromes**

| Error Bit-mask | Symbol In Error |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|----------------|-----------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

**2.13.2.3.2 x4 ECC**

The use of x4 ECC is indicated in [D18F3x180](#)[EccSymbolSize].

The syndrome field uniquely identifies the failing bit positions of a correctable ECC error. Only syndromes identified by [Table 126](#) are correctable by the error correcting code.

Symbols 00h-0Fh map to data bits 0-63; symbols 10h-1Fh map to data bits 64-127; symbols 20-21h map to ECC check bits for data bits 0-63; symbols 22-23h map to ECC check bits for data bits 64-127.

To use [Table 126](#), first find the 16-bit syndrome value in the table. This is performed by using low order 4 bits of the syndrome to select the appropriate error bitmask column. The entire four digit syndrome should then be in one of the rows of that column. The Symbol In Error row indicates which symbol, and therefore which DIMM has the error, and the column indicates which bits within the symbol.

For example, if the ECC syndrome is 6913h, then symbol 05h has the error, and bits 0 and 1 within that symbol are corrupted, since the syndrome is in column 3h (0011b). Symbol 05h maps to bits 23-20, so the corrupted bits are 20 and 21.

**Table 126: x4 ECC Correctable Syndromes**

| Symbol<br>In Error | Error Bitmask |      |      |      |      |      |      |      |      |      |      |      |      |      |      |  |

### 2.13.3 Error Injection and Simulation

Error injection allows the introduction of errors into the system for test and debug purposes. See the following sections for error injection details:

- DRAM: [2.13.3.1 \[DRAM Error Injection\]](#).
- Links:
  - [D18F0x\[14C:130\]](#)[ForceRetryError], [D18F3x44](#)[GenLinkSel, GenSubLinkSel, GenCrcErrByte1, GenCrcErrByte0].

Error simulation involves creating the appearance to software that an error occurred. This is performed by manually setting the MCA registers with desired values (see [MSRC001\\_0015](#)[McStatusWrEn]), and then driving the software via INT18. McStatusWrEn can be used to debug machine check interrupt handlers. When McStatusWrEn is set, privileged software can write non-zero values to the specified registers without generating exceptions, and then simulate a machine check using the INT18 instruction (INT $n$  instruction with an operand of 18). Setting a reserved bit in these registers does not generate an exception when this mode is enabled. However, setting a reserved bit may result in undefined behavior.

#### 2.13.3.1 DRAM Error Injection

This section gives details and examples on injecting errors into DRAM using [D18F3xBC\\_x8](#) [DRAM ECC]. The intent of DRAM error injection is to cause a discrepancy between the stored data and the stored ECC value. Therefore, DRAM error injection is only possible on DRAM which supports ECC, and in which [D18F2x90\\_dct\[1:0\]](#)[DimmEccEn] and [D18F3x44](#)[DramEccEn] are set.

The memory subsystem operates on 64-byte cachelines. The following fields are used to set how the cacheline is to be corrupted in DRAM:

- [D18F3xB8](#)[ArrayAddress] selects a cacheline quadrant (16-byte section) of the cacheline. Each cacheline quadrant is protected by an ECC word. Note that there are special requirements for which bits are used to specify the target quadrant.
- [D18F3xBC\\_x8](#)[ErrInjEn] selects a 16-bit word of the cacheline quadrant selected in ArrayAddress. The 16-bit word identified as ECC[15:0] refers to the bits which store the ECC value; the other 16-bit words address the data on which the ECC is calculated. One or more of these 16-bit words can be selected, and the error bitmask indicated in ErrVector is applied to each of the selected words.

- **D18F3xBC\_x8[ErrVector]** is a bitmask which selects the individual bits to be corrupted in the 16-bit words selected by **ErrInjEn**. When selecting the bits to be corrupted for correctable or uncorrectable errors, consider the ECC scheme being used, including symbol size; see 2.13.2 [DRAM Considerations for ECC] for more details. Note that corrupting more than two symbols may exceed the guarantees of the ECC to detect the errors; for testing purposes it is recommended that no more than two symbols be corrupted in a single cacheline quadrant.

The distinction between **D18F3xBC\_x8[DramErrEn]** and **D18F3xBC\_x8[EccWrReq]** is that **DramErrEn** is used to continuously inject errors on every write. This bit is set and cleared by software. **EccWrReq** is used to inject an error on only one write. This bit is set by software and is cleared by hardware after the error is injected.

When performing DRAM error injection on multi-node systems, the error injection registers of the NB to which the memory is attached must be programmed.

The following can be used to trigger the injection:

- The memory address is not an explicit parameter of the error injection interface. Once the error injection registers **D18F3xB8** and **D18F3xBC** are set, the next non-cached access of the appropriate type will trigger the mechanism and apply it to the accessed address. The access should be non-cached so that it is guaranteed to be seen by the memory controller. Possible methods to ensure a non-cached access include using the appropriate MTRR to set the memory type to UC or turning off caches. If it is important to know the address, then system activity must be quiesced so that the access can take place under careful software control. Once the error injection pattern is set in **D18F3xB8** and **D18F3xBC\_x8**:
  - Set either **D18F3xBC\_x8[EccWrReq]** or **D18F3xBC\_x8[DramErrEn]** to enable the triggering mechanism.
  - The next non-cached access of the appropriate type will trigger the mechanism and apply it to the accessed address.
  -

After the error is injected, the data must be referenced in order for the error detection to be triggered. The error address logged in **MSR0000\_0412 [NB Machine Check Address (MC4\_ADDR)]** will correspond to the cache-line quadrant that contains the error.

When using **MSR0000\_0411** to read **MC4\_STATUS** after an error injection and subsequent error detection, be aware that the setting of **D18F3x44[NbMcaToMstCpu]** can cause different cores to see different values. Alternatively, **MC4\_STATUS** can be read through the PCI-defined configuration space aliases **D18F3x4C** and **D18F3x48**, which do not return different values to different cores, regardless of the setting of **D18F3x44[NbMcaToMstCpu]**.

#### Example 1: Injecting a correctable error:

- Program error pattern:
  - **D18F3xB8[ArraySelect]=1000b** // select DRAM as target
  - **D18F3xB8[ArrayAddress]=000000000b** // select 16-byte (128-bit) section
  - **D18F3xBC\_x8[ErrInjEn]=000000001b** // select 16-bit word in 16-byte section
  - **D18F3xBC\_x8[EccRdReq]=0** // not a read request
  - **D18F3xBC\_x8[EccVector]=0001h** // set bitmask to inject error into only one symbol
- Program error trigger:
  - **D18F3xBC\_x8[DramErrEn]=0** // inject only a single error
  - **D18F3xBC\_x8[EccWrReq]=1** // a write request; enable injection on next write
- Clean up // if programmed for continuous errors
  - **D18F3xBC\_x8[DramErrEn]=0** // inject only a single error

### 2.13.4 Sideband Interface (SBI)

The sideband interface (SBI) is an SMBus v2.0 compatible 2-wire processor slave interface. SBI is also referred as the Advanced Platform Management Link. All I2C v2.1 speeds are supported.

SBI is used to communicate with the Remote Management Interface (SB-RMI) (see the *Advanced Platform Management Link (APML) Specification*, #41918). The processor is compliant to APML Revision=03h (D18F3x1EC\_x100[Revision]==03h).

#### 2.13.4.1 SBI Processor Information

Processor access to the SBI configuration is via D18F3x1E4 [SBI Control]. The processor can access the SB-RMI registers through D18F3x1E8 [SBI Address] and D18F3x1EC [SBI Data].

### 3 Registers

This section provides detailed field definitions for the core register sets in the processor.

#### 3.1 Register Descriptions and Mnemonics

Each register in this document is referenced with a mnemonic. Each mnemonic is a concatenation of the register-space indicator and the offset of the register. Here are the mnemonics for the various register spaces:

- **IOXXX**: x86-defined input and output address space registers; XXX specifies the hexadecimal byte address of the IO instruction. This space includes IO-space configuration access registers [IOCF8 \[IO-Space Configuration Address\]](#) and [IOCFC \[IO-Space Configuration Data Port\]](#). Accesses to these registers from each core of a processor target the same registers of that processor; it is not possible for a node to access these registers on a different node.
- **APICXX0**: APIC memory-mapped registers; XX0 is the hexadecimal byte address offset from the base address. See [2.4.8.1.2 \[APIC Register Space\]](#).
- **CPUID FnXXXX\_XXXX\_EiX[\_xYYY]**: processor capabilities information returned by the CPUID instruction. See [3.10 \[CPUID Instruction Registers\]](#). Each core may only access this information for itself.
- **MSRXXXX\_XXXX**: [MSRs](#); XXXX\_XXXX is the hexadecimal MSR number. This space is accessed through x86-defined RDMSR and WRMSR instructions. Unless otherwise specified there is one set of these registers [Per-core](#). See [2.4.1 \[Compute Unit\]](#).
- **DXFYxZZZ**: PCI-defined configuration space. E.g., D18F3x40 specifies the register at device 18h, function 3, and address 40h. See [2.8 \[Configuration Space\]](#), for details about configuration space.
  - X specifies the hexadecimal device number; this may be 1 or 2 digits.
    - Registers specified as D18:
      - Unless otherwise specified there is one set of these registers [Per-node](#); these registers in any node are accessible through any core of any node.
      - Bus 0 Device24 is D18=Node0; [D18F0x60\[NodeID\]=0](#).
      - Bus 0 Device25 is D19=Node1; [D19F0x60\[NodeID\]=1](#).
      - ...
      - Bus 0 Device31 is D1F=Node7; [D1Fxx60\[NodeID\]=7](#).
  - Y specifies the function number; this is 1 digit ranging in value from 0-7.
  - ZZZ specifies the hexadecimal byte address; this may be 2 or 3 digits.
  - Some registers in D18F2xXXX have the [\\_dct\[1:0\]](#) mnemonic suffix. See [2.10.1 \[DCT Configuration Registers\]](#).
  - Some registers accessed via [D18F4x1\[98,90,88,80\] \[Link Phy Offset\]](#) have the “[\\_dm\[1\]](#)” mnemonic suffix. See [D18F4x1\[98,90,88,80\] \[Link Phy Offset\]](#).
- **PMCxXXX**: core performance monitor events; XXX is the hexadecimal event counter number programmed into [MSRC001\\_020\[A,8,6,4,2,0\] \[Performance Event Select \(PERF\\_CTL\[5:0\]\)\]\[EventSelect\]](#); See [2.7.1 \[Core Performance Monitor Counters\]](#). **NBPMCxXXX**: NB performance monitor events; XXX is the hexadecimal event counter number programmed into [MSRC001\\_024\[6,4,2,0\] \[Northbridge Performance Event Select \(NB\\_PERF\\_CTL\[3:0\]\)\]\[EventSelect\]](#); See [2.7.2 \[NB Performance Monitor Counters\]](#).
  - When PMCxXXX or NBPMCxXXX is followed by [z:y] then UnitMask[z:y] is being specified.

Each mnemonic may specify the location of one or more registers that share the same base definition. A mnemonic that specifies more than one register will contain one or more ranges within braces. The ranges are spec-

ified as follows:

- Comma separated lists [A,B]: Define specific instances of a register, e.g., D0F3x[1,0]40 defines two registers D0F3x40 and D0F3x140.
- Colon separated ranges [A:B]: Defines all registers that contain the range between A and B. Examples:
  - D0F3x[50:40] defines five registers D0F3x40, D0F3x44, D0F3x48, D0F3x4C, and D0F3x50.
  - D[8:2]F0x40 defines seven registers D2F0x40, D3F0x40, D4F0x40, D5F0x40, D6F0x40, D7F0x40, and D8F0x40.
  - D0F0xE4\_x013[2:0]\_0000 defines three registers D0F0xE4\_x0130\_0000, D0F0xE4\_x0131\_0000, and D0F0xE4\_x0132\_0000.
- Colon separated ranges with an explicit step [A:BstepC]: Defines the registers from A to B, C defines the offset between registers., e.g., D0F3x[50:40:step8] defines three registers D0F3x40, D0F3x48, and D0F3x50.

The processor includes a single set of IO-space and configuration-space registers. However, APIC, CPUID, and MSR register spaces are implemented once per processor core. Access to IO-space and configuration space registers may require software-level techniques to ensure that no more than one core attempts to access a register at a time.

The following is terminology found in the register descriptions.

**Table 127: Terminology in Register Descriptions**

| Term                | Definition   |
|---------------------|--|
| BIOS                | Software recommendation syntax. See 3.1.2 [Software Recommendation (BIOS, SBIOS)].   |
| SBIOS               |  |
| See                 | Reference to remote definition. See 3.1.3 [See Keyword (See:)].  |
| Alias               | The alias keyword allows the definition of a soft link between two registers. <ul style="list-style-type: none"><li>• X is an alias of Y: X is a soft link to the register Y.</li><li>• X1, X2 are an alias of Y: Both X1 and X2 are soft links to Y.</li></ul>  |
| IF                  | Allows conditional definition as a function of register fields. The syntax is: <ul style="list-style-type: none"><li>• IF (conditional-expression) THEN definition ENDIF.</li><li>• IF (conditional-expression) THEN definition ELSE definition ENDIF.</li><li>• IF (conditional-expression) THEN definition ELSEIF (conditional-expression) definition ELSE definition ENDIF.</li></ul> |
| THEN                |  |
| ELSEIF              |  |
| ELSE                |  |
| ENDIF               |  |
| Access Types        |  |
| Read                | Capable of being read by software.   |
| Read-only           | Capable of being read but not written by software.   |
| Write               | Capable of being written by software.  |
| Write-only          | Write-only. Capable of being written by software. Reads are undefined.   |
| Read-write          | Capable of being written by software and read by software.   |
| Set-by-hardware     | Register field is set high by hardware, set low by hardware, or updated by hardware.   |
| Cleared-by-hardware |  |
| Updated-by-hardware |  |
| Write-1-to-clear    | Software must write a 1 to the bit in order to clear it. Writing a 0 to these bits has no affect.  |
| Write-1-only        | Software can set the bit high by writing a 1 to it. Writes of 0 have no effect.  |

**Table 127: Terminology in Register Descriptions**

| Term              | Definition  |
|-------------------|---|
| SharedC           | Shared by both cores of a compute unit: <a href="#">SharedC</a> (shared coherent) or <a href="#">SharedNC</a> (shared non-coherent). See <a href="#">2.4.1.1 [Registers Shared by Cores in a Compute Unit]</a> for a definition of coherent.  |
| SharedNC          |   |
| SBI-only          | No host software access; host accesses result in GP-read-write. HDT access supported. SB-RMI access documented by the APLM spec. See <a href="#">2.13.4 [Sideband Interface (SBI)]</a> .  |
| Reset-applied     | Takes affect on warm reset.   |
| GP-read           | GP exception occurs on read.  |
| GP-write          | GP exception occurs on write.   |
| GP-read-write     | GP exception occurs on a read or a write.   |
| Per-core          | One instance per core. Writes of these bits from one core only affect that core’s register. Reads return the values appropriate to that core.   |
| Per-compute-unit  | One instance per compute unit. Writes of these bits from one core only affect that compute unit’s register. Reads return the values appropriate to that compute unit.   |
| Per-node          | One instance per node. See <a href="#">3.1.1 [Northbridge MSRs In Multi-Core Products]</a> .  |
| Not-same-for-all  | Provide indication as to whether all instances of a given register should be the same across all cores/nodes according to the following equation:<br>SameOnAllCheckEnabled = ((same-for-all    MSR    CPUID) && ~(not-same-for-all    UpdatedByHw)). UpdatedByHw = (Updated-by-hardware    set-by-hardware    cleared-by-hardware    set-when-done    cleared-when-done). |
| Same-for-all      |   |
| Same-within-node  |   |
| Same-within-pkg   |   |
| Field Definitions |   |
| Reserved          | Field is reserved for future use. Software is required to preserve the state read from these bits when writing to the register. Software may not depend on the state of reserved fields nor on the ability of such fields to return the state previously written.   |
| Unused            | Field is reserved for future use. Software is not required to preserve the state read from these bits when writing to the register. Software may not depend on the state of unused fields nor on the ability of such fields to return the state previously written.   |
| MBZ               | Must be zero. If software attempts to set an MBZ bit to 1, a general-protection exception (#GP) occurs.   |
| RAZ               | Read as zero. Writes are ignored, unless RAZ is combined with write, write-1-only, or write-once.   |
| Reset Definitions |   |

**Table 127: Terminology in Register Descriptions**

| Term              | Definition  |
|-------------------|---|
| <b>Reset</b>      | The reset value of each register is provided below the mnemonic or in the field description. Unless otherwise noted, the register state matches the reset value when RESET_L is asserted (either a cold or a warm reset). Reset values may include: <ul style="list-style-type: none"> <li>• <b>X</b>: an X in the reset value indicates that the field resets (warm or cold) to an unspecified state.</li> </ul> |
| <b>Cold reset</b> | The field state is not affected by a warm reset (even if the field is labeled “cold reset: X”); it is placed into the reset state when PWROK is deasserted. See "Reset" above for the definition of characters that may be found in the cold reset value.   |
| <b>Value</b>      | The current value of a read-only field or register. A value statement explicitly defines the field or register as read-only and the value returned under all conditions including after reset events. A field labeled “Value:” will not have a separate reset definition.   |

### 3.1.1 Northbridge MSRs In Multi-Core Products

MSRs that control Northbridge functions are shared between all cores on the node in a multi-core processor (e.g. [MSRC001\\_001F](#)). If control of Northbridge functions is shared between software on all cores, software must ensure that only one core at a time is allowed to access the shared MSR. Some MSR's are conditionally shared; see [D18F3x44](#)[NbMcaToMstCpuEn].

### 3.1.2 Software Recommendation (BIOS, SBIOS)

The following keywords specify the recommended value to be set by software.

- BIOS is AMD BIOS.
- SBIOS is system BIOS.

Syntax: BIOS:<integer-expression>. Any of the supported tags can be substituted for BIOS.

If “BIOS:” occurs in a register field then the recommended value is applied to the field. If “BIOS:” occurs after a register name but outside of a register field table row then the recommended value is applied to the width of the register.

### 3.1.3 See Keyword (See:)

There is a special meaning applied to the use of “See:” that differs from the use of See not followed by a “:”.

- See, not followed by a “:”, simply refers the reader to a document location that contains related information.
- See followed by a “:” is a shorthand notation that indicates that the definition for this register or register field inherits all properties and definitions from the register or register field that follows "See:". Any definition local to the register or register field supercedes this inheritance.

“See:” can be used in the following ways:

- Full register width. [CPUID Fn0000\\_0001\\_EAX](#) inherits it's full register width definition from [D18F3xFC](#).
- Register field. [MSR0000\\_0277](#)[PA1MemType] inherits it's definition from PA0MemType, however, the local reset of 4h overrides the inherited PA0MemType reset of 6h.
- Valid values definition. [MSR0000\\_020](#)[F:0][MemType], for example, inherits the valid values definition from [Table 260](#) [Valid Values for Memory Type].

### 3.1.4 Mapping Tables

The following mapping table types are defined.

#### 3.1.4.1 Register Mapping

The register mapping table specifies the specific function for each register in a range of registers.

[Table 128](#), for example, specifies that the D18F0x40 function is for Node 0, resulting in the D18F0x40 name “Routing Table - Node 0”.

#### 3.1.4.2 Index Mapping

The index mapping table is similar to the register mapping table, but specifies the register by index instead of by full register mnemonic.

[Table 186](#), for example, specifies that the D18F2x98\_dct[1:0][31:0]==0D0F\_0031h, or D18F2x9C\_x0D0F\_0031\_dct[1:0], function is for Byte 0, resulting in the register name “Data Byte Fence2 Threshold - Byte0”.

#### 3.1.4.3 Field Mapping

The field mapping table maps the fields of a range of registers. The rows are the registers that are mapped. Each column specifies a field bit range that is mapped by that column for all rows. The cell at the intersection of the register row and the field bit range column specifies the suffix that is appended to the register field with a “\_”. “Reserved” specifies that the field is reserved for the register of that row.

[Table 162](#), for example, specifies that the fields at D18F2x9C\_x0000\_0[3:0]01[31:24] should have the suffix Byte3, resulting in WrDatGrossDly\_Byte3 and WrDatFineDly\_Byte3.

#### 3.1.4.4 Broadcast Mapping

The broadcast mapping table maps a register address to a range of register addresses that are written as a group when the broadcast register address is written. The register address is formed by the concatenation of the row address with the column address. The cell at the intersection of the row and column address is a range of register addresses that will be written as a group when the row and column address is written.

[Table 187](#), for example, specifies that a write to D18F2x98\_dct[1:0][31:0]==0D0F\_0F31h will result in a broadcast write to the D18F2x9C\_x0D0F\_0[8:0]31 range of registers.

#### 3.1.4.5 Reset Mapping

The reset mapping table specifies the reset, cold reset, or value for each register in a range of registers.

[Table 255](#), for example, specifies that the CPUID Fn0000\_0000\_EBX register has a value of 6874\_7541h, with a comment of “The ASCII characters “h t u A””.

#### 3.1.4.6 Valid Values

The valid values table defines the valid values for one or more register fields. The valid values table is equivalent in function to the Bits/Description tables in register fields (E.g. D18F0x16C[ForceFullT0]) and is most

often used when the table becomes too large and unwieldy to be included into the register field. (E.g. [Table 160 \[Valid Values for D18F2x94\\_dct\[1:0\]\[MemClkFreq\]\]](#))

### 3.1.4.7 BIOS Recommendations

The BIOS recommendations table defines “BIOS:” recommendations that are conditional and complex enough to warrant a table.

[Table 215 \[BIOS Recommendations for D18F3x140\[FreeTok, UpRspTok\]\]](#), for example, specifies the BIOS recommendations for [D18F3x140\[FreeTok, UpRspTok\]](#). All cells under the “Condition” header for a given row are ANDed to form the condition for the values to the right of the condition. For example, rows 1-3 provides the following equivalent BIOS recommendations:

- [D18F3x140\[FreeTok\]](#): BIOS: IF (SCM) THEN 10 ELSEIF ((MCM1 | MCM2h) & PrbFltrEn) THEN 9 ELSEIF ((MCM1 | MCM2h) & ~PrbFltrEn) THEN 10 ELSEIF etc.
- [D18F3x140\[UpRspTok\]](#): BIOS: IF (SCM) THEN 3 ELSEIF ((MCM1 | MCM2h) & PrbFltrEn) THEN 3 ELSEIF ((MCM1 | MCM2h) & ~PrbFltrEn) THEN 3 ELSEIF etc.

[Table 88 \[BIOS Recommendations for F0RC13\[NumLogicalRanks\]\]](#), for example, describes a condition in a different manner. When the condition column has a name, such as [NumDimmSlots](#), then only one of the list of values must match to be true. E.g. If the cell for the [NumDimmSlots](#) column contains “1, 2” then the resulting condition is ((NumDimmSlots==1) | (NumDimmSlots==2)). Also, a “-” indicates that the cell is not included into the condition. The resulting BIOS recommendation for row 3 is:

- [F0RC13\[NumLogicalRanks\]](#): BIOS: ... ELSEIF ((F0RC13[NumPhysicalRanks]==10b) & ((NumDimmSlots==1) | (NumDimmSlots==2))) THEN 10b ELSEIF ...

## 3.2 IO Space Registers

See [3.1 \[Register Descriptions and Mnemonics\]](#) for a description of the register naming convention.

### IOCF8 IO-Space Configuration Address

Reset: 0. [IOCF8 \[IO-Space Configuration Address\]](#), and [IOCFC \[IO-Space Configuration Data Port\]](#), are used to access system configuration space, as defined by the PCI specification. [IOCF8](#) provides the address register and [IOCFC](#) provides the data port. Software sets up the configuration address by writing to [IOCF8](#). Then, when an access is made to [IOCFC](#), the processor generates the corresponding configuration access to the address specified in [IOCF8](#). See [2.8 \[Configuration Space\]](#).

[IOCF8](#) may only be accessed through aligned, DW IO reads and writes; otherwise, the accesses are passed to the appropriate IO link. Accesses to [IOCF8](#) and [IOCFC](#) received from an IO link are treated as all other IO transactions received from an IO link and are forwarded based on the settings in [D18F1x\[DC:C0\] \[IO-Space Base/Limit\]](#). [IOCF8](#) and [IOCFC](#) in the processor are not accessible from an IO link.

| Bits  | Description   |
|-------|---|
| 31    | <b>ConfigEn: configuration space enable.</b> Read-write. 1=IO read and write accesses to <a href="#">IOCFC</a> are translated into configuration cycles at the configuration address specified by this register. 0=IO read and write accesses are passed to the appropriate IO link and no configuration access is generated. |
| 30:28 | Reserved.   |
| 27:24 | <b>ExtRegNo: extended register number.</b> Read-write. ExtRegNo provides bits[11:8] and RegNo provides bits[7:2] of the byte address of the configuration register. ExtRegNo is reserved unless it is enabled by <a href="#">MSRC001_001F[EnableCf8ExtCfg]</a> .  |
| 23:16 | <b>BusNo: bus number.</b> Read-write. Specifies the bus number of the configuration cycle.  |

|       |   |
|-------|---|
| 15:11 | <b>Device: device number.</b> Read-write. Specifies the device number of the configuration cycle. |
| 10:8  | <b>Function.</b> Read-write. Specifies the function number of the configuration cycle.            |
| 7:2   | <b>RegNo: register address.</b> Read-write. See <a href="#">IOCF8[ExtRegNo]</a> .                 |
| 1:0   | Reserved.   |

### IOCF8 IO-Space Configuration Data Port

| Bits | Description  |
|------|--|
| 31:0 | <b>Data.</b> Read-write. Reset: 0. See <a href="#">IOCF8</a> . |

### 3.3 Device [1F:18]h Function 0 Configuration Registers

See [3.1 \[Register Descriptions and Mnemonics\]](#). See [2.8 \[Configuration Space\]](#).

#### D18F0x00 Device/Vendor ID

| Bits  | Description  |
|-------|--|
| 31:16 | <b>DeviceID: device ID.</b> Read-only. Value: 1600h. |
| 15:0  | <b>VendorID: vendor ID.</b> Read-only. Value: 1022h. |

#### D18F0x04 Status/Command

| Bits  | Description   |
|-------|---|
| 31:16 | <b>Status.</b> Read-only. Value: 0010h. Bit[20] is set to indicate the existence of a PCI-defined capability block. |
| 15:0  | <b>Command.</b> Read-only. Value: 0000h.  |

#### D18F0x08 Class Code/Revision ID

| Bits | Description   |
|------|---|
| 31:8 | <b>ClassCode.</b> Read-only. Value: 060000h. Provides the host bridge class code as defined in the PCI specification. |
| 7:0  | <b>RevID: revision ID.</b> Read-only. Value: 00h.   |

#### D18F0x0C Header Type

Read-only. Value: 0080\_0000h.

| Bits | Description   |
|------|---|
| 31:0 | <b>HeaderTypeReg.</b> These bits are fixed at their default values. The header type field indicates that there are multiple functions present in this device. |

**D18F0x34 Capabilities Pointer**

| Bits    | Description  |      |             |         |          |     |                         |         |          |     |   |         |          |     |  |         |          |     |  |         |          |
|---------|--|------|-------------|---------|----------|-----|-------------------------|---------|----------|-----|---|---------|----------|-----|--|---------|----------|-----|--|---------|----------|
| 31:8    | Reserved.  |      |             |         |          |     |                         |         |          |     |   |         |          |     |  |         |          |     |  |         |          |
| 7:0     | <b>CapPtr: capabilities pointer.</b> Read-only. Value: Product-specific. Specifies the offset of the link capabilities block based on the links that are supported by the node. <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>7Fh-00h</td><td>Reserved</td></tr> <tr> <td>80h</td><td>If link 0 is supported.</td></tr> <tr> <td>9Fh-81h</td><td>Reserved</td></tr> <tr> <td>A0h</td><td>If link 0 is not supported and link 1 is supported.</td></tr> <tr> <td>BFh-A1h</td><td>Reserved</td></tr> <tr> <td>C0h</td><td>If link 0 and 1 are not supported and link 2 is supported.</td></tr> <tr> <td>DFh-C1h</td><td>Reserved</td></tr> <tr> <td>E0h</td><td>If link 0, 1, and 2 are not supported and link 3 is supported.</td></tr> <tr> <td>FFh-E1h</td><td>Reserved</td></tr> </table> | Bits | Description | 7Fh-00h | Reserved | 80h | If link 0 is supported. | 9Fh-81h | Reserved | A0h | If link 0 is not supported and link 1 is supported. | BFh-A1h | Reserved | C0h | If link 0 and 1 are not supported and link 2 is supported. | DFh-C1h | Reserved | E0h | If link 0, 1, and 2 are not supported and link 3 is supported. | FFh-E1h | Reserved |

**D18F0x[5C:40] Routing Table**

Reset: 0004\_0201h. As each packet is processed by the node, it is routed to the appropriate links, or remains in the node that is processing the packet, based on the source/destination node and the type of packet being processed. The destination of requests and responses determines which of these eight registers is used to route the packet; the source of probes and broadcasts determines which of these eight registers is used to route the packet. Once the routing table register is identified, the packet is routed to the destinations based on the state of the field (in that routing table register) that corresponds to the packet type.

**Table 128: Register Mapping for D18F0x[5C:40]**

| Register | Function |
|----------|----------|
| D18F0x40 | Node 0   |
| D18F0x44 | Node 1   |
| D18F0x48 | Node 2   |
| D18F0x4C | Node 3   |
| D18F0x50 | Node 4   |
| D18F0x54 | Node 5   |
| D18F0x58 | Node 6   |
| D18F0x5C | Node 7   |

| Bits  | Description   |
|-------|---|
| 31:27 | Reserved.   |
| 26:18 | <b>BCRoute: broadcast route.</b> Specifies the routing information for broadcasts and probes. See: RQRoute. |

|            |  |
|------------|--|
| 17:9       | <b>RPRoute: response route.</b> Specifies the routing information for responses. See: RQRoute. |
| 8:0        | <b>RQRoute: request route.</b> Read-write. Specifies the routing information for requests.     |
| <u>Bit</u> | <u>Description</u>   |
| [0]        | Route to this node.  |
| [1]        | Route to link 0, Sublink 0.  |
| [2]        | Route to link 1, Sublink 0.  |
| [3]        | Route to link 2, Sublink 0.  |
| [4]        | Route to link 3, Sublink 0.  |
| [5]        | Route to link 0, Sublink 1.  |
| [6]        | Route to link 1, Sublink 1.  |
| [7]        | Route to link 2, Sublink 1.  |
| [8]        | Route to link 3, Sublink 1.  |

**D18F0x60 Node ID**

| Bits        | Description   |
|-------------|---|
| 31:21       | Reserved.   |
| 20:16       | <b>CpuCnt[4:0]: CPU count bits[4:0].</b> Read-write. CpuCnt[7:0] = {D18F0x160[CpuCnt[7:5]], D18F0x60[CpuCnt[4:0]]}. Reset: 0. CpuCnt[7:0] specifies the number of cores to be enabled in the system (the boot core of all nodes plus those cores enabled through D18F0x1DC[CpuEn]). 00h=1 core...3F = 64 cores; 40h through FFh are reserved. This field matches D18F0x60[NodeCnt] if each nodes in the system has one core; otherwise, it would be greater than D18F0x60[NodeCnt]. |
| 15          | Reserved.   |
| 14:12       | <b>LkNode: lock node ID bits.</b> Read-write. Reset: 0. Specifies the node ID of the node that contains the lock controller.  |
| <u>Bits</u> | <u>Description</u>  |
| 000b        | Node 0  |
| 001b        | Node 1  |

### D18F0x64 Unit ID

Reset: 0000\_00E0h.

| Bits  | Description   |
|-------|---|
| 31:11 | Reserved.   |
| 10:8  | <b>SbLink: Southbridge (IO hub) link ID.</b> Read-write; set-by-hardware. Specifies the link to which the system IO hub is connected. It is only used by the node which owns the IO hub, as indicated in <a href="#">D18F0x60[NodeId]</a> . For SbLink[1:0]: 00b=link 0; 01b=link 1; 10b=link 2; 11b=link 3. If the link is unganged, then SbLink[2] specifies the sublink: 0=sublink 0; 1=sublink 1. If the link is ganged, SbLink[2] is required to be low. |
| 7:6   | <b>HbUnit: host bridge Unit ID.</b> Read-only. Specifies the coherent link Unit ID of the host bridge used by the coherent fabric.  |
| 5:4   | <b>MctUnit: memory controller Unit ID.</b> Read-only. Specifies the coherent link Unit ID of the memory controller.   |
| 3:0   | Reserved.   |

### D18F0x68 Link Transaction Control

| Bits | Description  |
|------|--|
| 31   | <b>EnPReqHiPriTbIWlk: isoc table walk enable for posted requests.</b> Read-write. Reset: 0. 1=Enables the use of the Isoc channel for GART table walk requests issued for base channel posted requests. To use the Isoc channel for GART requests ICFM must be enabled, one <a href="#">D18F3x1[54,50,4C,48][IsocReqTok]</a> must be allocated on each link that can receive GART table walk requests, and one <a href="#">D18F3x1[54,50,4C,48][IsocRspTok]</a> must be allocated on each link that can receive GART table walk responses. |

| 30:26 | Reserved.  |      |             |     |          |     |              |     |              |     |              |
|-------|--|------|-------------|-----|----------|-----|--------------|-----|--------------|-----|--------------|
| 25    | <b>CHtExtAddrEn: coherent link extended address enable.</b> IF (D18F3xE8[MpCap]) THEN Read-write; Same-for-all. ELSE Read-only; Same-for-all. ENDIF. Reset: 0. 1=The coherent fabric supports physical addresses of greater than 40 bits. 0=Requests to addresses above 1 TB result in a master abort.   |      |             |     |          |     |              |     |              |     |              |
| 24    | <b>DispRefModeEn.</b> Read-write. Reset: 0. 1=Enables support for display-refresh ordering rules. BIOS must not set this bit until display-refresh buffers have been allocated and a warm reset has occurred. See 2.9.3.2.5 [Display Refresh And IFCM].  |      |             |     |          |     |              |     |              |     |              |
| 23    | <b>InstallStateS.</b> Read-write. Reset: 0. 1=Forces the default read block (RdBlk) install state to be shared instead of exclusive.   |      |             |     |          |     |              |     |              |     |              |
| 22:21 | <b>DsNpReqLmt: downstream non-posted request limit.</b> Read-write. Reset: 00b. BIOS: 10b. This specifies the maximum number of downstream non-posted requests issued by core(s) which may be outstanding on the IO links attached to this node at one time.<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>No limit</td></tr> <tr> <td>01b</td><td>limited to 1</td></tr> <tr> <td>10b</td><td>limited to 4</td></tr> <tr> <td>11b</td><td>limited to 8</td></tr> </table>   | Bits | Description | 00b | No limit | 01b | limited to 1 | 10b | limited to 4 | 11b | limited to 8 |
| Bits  | Description  |      |             |     |          |     |              |     |              |     |              |
| 00b   | No limit   |      |             |     |          |     |              |     |              |     |              |
| 01b   | limited to 1   |      |             |     |          |     |              |     |              |     |              |
| 10b   | limited to 4   |      |             |     |          |     |              |     |              |     |              |
| 11b   | limited to 8   |      |             |     |          |     |              |     |              |     |              |
| 20    | <b>SeqIdSrcNodeEn: sequence ID source node enable.</b> Read-write. Reset: 0. 1=The source node ID of requests is provided in the SeqID field of the corresponding downstream IO link request packets. This may be useful for debug applications, in order to match downstream packets with their originating node. For normal operation, this bit should be cleared. Correct ordering of requests between different nodes is not ensured when this bit is set. Semaphore sharing between differing nodes may not work properly in systems which are capable of processing IO requests with differing non-zero seqids out of request order. |      |             |     |          |     |              |     |              |     |              |
| 19    | <b>ApicExtSpur: APIC extended spurious vector enable.</b> Read-write. Reset: 0. This enables the extended APIC spurious vector functionality; it affects APICF0[Vector]. 0=The lower 4 bits of the spurious vector are read-only 1111b. 1=The lower 4 bits of the spurious vector are writable.  |      |             |     |          |     |              |     |              |     |              |
| 18    | <b>ApicExtId: APIC extended ID enable.</b> Read-write. Reset: 0. Enables the extended APIC ID functionality. 0=APIC ID is 4 bits. 1=APIC ID is 8 bits.   |      |             |     |          |     |              |     |              |     |              |
| 17    | <b>ApicExtBrdCst: APIC extended broadcast enable.</b> Read-write. Reset: 0. Enables the extended APIC broadcast functionality. 0=APIC broadcast is 0Fh. 1=APIC broadcast is FFh. If ApicExtBrdCst=1 then software must assert ApicExtId.   |      |             |     |          |     |              |     |              |     |              |
| 16    | <b>LintEn: local interrupt conversion enable.</b> Read-write. Reset: 0. 1=Enables the conversion of broadcast ExtInt and NMI interrupt requests to LINT0 and LINT1 local interrupts, respectively, before delivering to the local APIC. This conversion only takes place if the local APIC is hardware enabled. LINT0 and LINT1 are controlled by APIC3[60:50]. 0=ExtInt/NMI interrupts delivered unchanged.   |      |             |     |          |     |              |     |              |     |              |
| 15    | <b>LimitCldtCfg: limit coherent link configuration space range.</b> Read-write. Reset: 0. 1=Configuration accesses that (1) normally map to the configuration space within another node in the coherent fabric and (2) target a non-existent node as specified by D18F0x60[NodeCnt] are sent to an IO link instead. This bit should be set by BIOS once coherent fabric initialization is complete. Failure to do so may result in PCI configuration accesses to nonexistent nodes being sent into the coherent fabric, causing the system to hang.  |      |             |     |          |     |              |     |              |     |              |

| 14:13       | <p><b>BufRelPri: buffer release priority select.</b> Read-write. Reset: 00b. BIOS: 01b. |       |   |
|-------|---|
| 26:24 | <b>WidthIn: link width in.</b> Read-write; reset-applied. Specifies the operating width of the incoming link. See <a href="#">D18F0x[E4,C4,A4,84][WidthOut]</a> for legal values. The cold reset value of this field depends on the widths of the links of the connecting device, per the link specification. This field cannot be set to 16 bits when reganging a link until <a href="#">D18F0x[18C:170][Ganged]</a> has been set to 1. This field cannot be changed by software if the link was determined to be disconnected by hardware at cold reset. After this field is written to by software, the link width does not change until either a warm reset or a link disconnect sequence occurs through LDTSTOP_L.   |
| 23    | Reserved.   |
| 22:20 | <b>MaxWidthOut: max link width out.</b> Read-only. Specifies the width of the outgoing link to be 8 bits or 16 bits wide, depending on the processor version. See <a href="#">D18F0x[E4,C4,A4,84][WidthOut]</a> for the encoding. Indicates an 8-bit link if the link is unganged.  |
| 19    | Reserved.   |
| 18:16 | <b>MaxWidthIn: max link width in.</b> Read-only. Specifies the width of the incoming link to be 8 bits or 16 bits wide, depending on the processor version. See <a href="#">D18F0x[E4,C4,A4,84][WidthOut]</a> for the encoding. Indicates an 8-bit link if the link is unganged.  |
| 15    | <b>Addr64BitEn: 64-bit address packet enable.</b> Read-write. Cold reset: 0. 1=Requests to addresses greater than FF_FFFF_FFFFh are supported by this IO link. 0=Requests to addresses greater than FF_FFFF_FFFFh are master aborted as if the end of chain was reached. BIOS is required to ensure that the link-specification-defined “64 Bit Address Feature” bit in the device on the other side of the link is set prior to setting this bit. For coherent links, this bit is unused. <a href="#">D18F0x68[CHtExtAddrEn]</a> is required to be set if this bit is set for any IO link. The link specification indicates that this bit is cleared by a warm reset; therefore this bit may be in a different state than an IO device on the other side of the link after a warm reset; care should be taken by BIOS to place devices on both sides of the link in the same state after a warm reset, before any packets to the high-order addresses enabled by this bit are generated. |
| 14    | <b>ExtCTL: extended control time during initialization.</b> Read-write. Cold reset: 0. This specifies the time in which the link CTL signal is held asserted during the initialization sequence that follows an LDTSTOP_L deassertion, after CTL is detected asserted. 0=At least 16 bit times. 1=About 50 us. ExtCTL is ignored at Gen3 frequencies.   |
| 13    | <b>LdtStopTriEn: LDTSTOP_L tristate enable.</b> Read-write. Cold reset: 0. BIOS: IF (C32r1) THEN 1 ELSE 0 ENDIF. This bit is ignored by hardware when the link is operating at Gen3 frequencies. 1=During the LDTSTOP_L disconnect sequence, the link transmitter signals are placed into the high-impedance state and the receivers are prepared for the high-impedance mode. For the receivers, this includes cutting power to the receiver differential amplifiers and ensuring that there are no resultant high-current paths in the circuits. 0=During the LDTSTOP_L disconnect sequence, the link transmitter signals are driven, but in an undefined state, and the link receiver signals are assumed to be undriven.  |
| 12    | <b>IsocEn: isochronous flow-control mode enable.</b> Read-write; reset-applied. Cold reset: 0. This bit is set to place the link into isochronous flow-control mode (IFCM), as defined by the link specification. 1=IFCM. 0=Normal flow-control mode. All coherent links of the system must use the same flow-control mode. See <a href="#">2.9.3.2.5 [Display Refresh And IFCM]</a> .  |
| 11:10 | Reserved.   |

|     |  |
|-----|--|
| 9:8 | <b>CrcErr: CRC Error.</b> Read; set-by-hardware; write-1-to-clear. Cold reset: 00b. Bit[1] applies to the upper byte of the link and bit[0] applies to the lower byte. 1=The hardware detected a CRC error on the incoming link while not in retry mode; if in retry mode, then bit[8] may be set to indicate an uncorrectable error was detected; such uncorrectable error cases are:<br>Link reconnect fails exceeding the limit in <a href="#">D18F0x150 [Link Global Retry Control]</a> [TotalRetryAttempts].  |
| 7   | <b>TransOff: transmitter off.</b> Read-write. 1=Output tristates. Notes about TransOff and EndOfChain: The initial state is programmed by hardware after each cold reset (0 if the link connects; 1 if it does not connect; see <a href="#">2.12.1.3 [Link Type Detect]</a> ).<br>If <a href="#">D18F0x16C[ConnDly]=0</a> : setting these bits causes the link behavior to change immediately; clearing these bits is illegal; warm reset and LDTSTOP_L do not affect the state of these bits; TransOff may only be set if EndOfChain is set.<br>If <a href="#">D18F0x16C[ConnDly]=1</a> : values written to these bits take effect during the next warm reset or LDTSTOP_L. Reads represent the last value written rather than the current link behavior; TransOff and EndOfChain should always be programmed to the same state. BIOS: For dual-node processors, BIOS should program this according to <a href="#">2.12.1.5 [Link Mapping Between Package and Node]</a> . |
| 6   | <b>EndOfChain: end of chain.</b> Read-write. 1=The link is not part of the logical HyperTransport™ technology chain; packets targeting this link are dropped. See TransOff, above. BIOS: For dual-node processors, BIOS should program this according to <a href="#">2.12.1.5 [Link Mapping Between Package and Node]</a> .  |
| 5   | <b>InitComplete: initialization complete.</b> Read-only; set-by-hardware. Reset: 0. This bit is set by hardware when low-level link initialization has successfully completed. If there is no device on the other end of the link, or if the device on the other side of the link is unable to properly perform link initialization, then the bit is not set. This bit is not cleared for LDTSTOP_L disconnects or retries. Hardware may report 0 during BIST mode or ILM.   |
| 4   | <b>LinkFail: link failure.</b> Read; set-by-hardware; write-1-to-clear. Cold reset: 0. This bit is set high by the hardware when a CRC error is detected on the link (if enabled by CrcFloodEn), the link fails to reconnect, if a sync flood is received by the link, or if the link is not used in the system. See <a href="#">2.13.1.9.1 [Common Diagnosis Information]</a> .   |
| 3   | <b>CrcForceErr: CRC force error command.</b> Read-write. Reset: 0. 1=The link transmission logic generates erroneous periodic or per-packet CRC values on all enabled byte lanes. 0=Transmitted CRC values match the values calculated per the link specification. This bit is intended to be used to check the CRC failure detection logic of the device on the other side of the link. See <a href="#">D18F0x150[ForceErrType]</a> for retry mode.   |
| 2   | Reserved.  |
| 1   | <b>CrcFloodEn: CRC flood enable.</b> Read-write. Reset: 0. 1=Setting either of the CrcErr bits results in sync packets to all enabled outgoing links and the <a href="#">D18F0x[E4,C4,A4,84][LinkFail]</a> bit is set. 0=Setting either of the CrcErr bits do not result in sync packets or setting the <a href="#">D18F0x[E4,C4,A4,84][LinkFail]</a> bit. In Gen3 protocol, exceeding the <a href="#">D18F0x150[TotalRetryAttempts]</a> limit results in a sync flood regardless of how CrcFloodEn is set. The resulting sync flood does not propagate to other links or set Linkfail unless CrcFloodEn is set. This bit is ignored if <a href="#">D18F3x44[SyncPktGenDis]</a> is set.  |
| 0   | Reserved.  |

**D18F0x[E8,C8,A8,88] Link Frequency/Revision**

See [2.12.1.3.1 \[Link Specific Registers\]](#). This register is derived from the link frequency/revision register

defined in the link specification.

Table 131: [Register Mapping](#) for D18F0x[E8,C8,A8,88]

| 11:8 | <p><b>Freq[3:0]: link frequency.</b> Read-write; Reset-applied. Freq[4:0] = {D18F0x[FC,DC,BC,9C][Freq[4]], D18F0x[E8,C8,A8,88][Freq[3:0]]}. Cold reset: 0h. When D18F0x[FC,DC,BC,9C][Freq[4]] is set or cleared, D18F0x[E8,C8,A8,88][Freq[3:0]] must be written to the correct value before D18F0x[FC,DC,BC,9C][Freq[4]] is written. After this field is updated, the link frequency does not change until either a warm reset or a link disconnect sequence occurs through LDTSTOP_L. The value read from this field is the last value written. Writes to this field are ignored if a non-supported frequency is written.</p> <table><tr><th>Bits</th><th>Link Frequency</th><th>Bits</th><th>Link Frequency</th></tr><tr><td>00h</td><td>0.2 GHz.<sup>2</sup></td><td>10h</td><td>Reserved</td></tr><tr><td>01h</td><td>Reserved</td><td>11h</td><td>2.8 GHz.</td></tr><tr><td>02h</td><td>0.4 GHz.<sup>2</sup></td><td>12h</td><td>3.0 GHz.</td></tr><tr><td>03h</td><td>Reserved</td><td>13h</td><td>3.2 GHz.</td></tr><tr><td>04h</td><td>0.6 GHz.<sup>2</sup></td><td>14h</td><td>Reserved</td></tr><tr><td>05h</td><td>0.8 GHz.<sup>2</sup></td><td>15h</td><td>Reserved</td></tr><tr><td>06h</td><td>1.0 GHz.<sup>1, 2</sup></td><td>1Fh-16h</td><td>Reserved</td></tr><tr><td>07h</td><td>1.2 GHz.</td><td></td><td></td></tr><tr><td>08h</td><td>1.4 GHz.</td><td></td><td></td></tr><tr><td>09h</td><td>1.6 GHz.</td><td></td><td></td></tr><tr><td>0Ah</td><td>1.8 GHz.</td><td></td><td></td></tr><tr><td>0Bh</td><td>2.0 GHz.</td><td></td><td></td></tr><tr><td>0Ch</td><td>2.2 GHz.<sup>2</sup></td><td></td><td></td></tr><tr><td>0Dh</td><td>2.4 GHz.</td><td></td><td></td></tr><tr><td>0Eh</td><td>2.6 GHz.<sup>2</sup></td><td></td><td></td></tr><tr><td>0Fh</td><td>Reserved.</td><td></td><td></td></tr></table> <p>Note:</p> <ol style="list-style-type: none"><li>1. <b>G34r1</b>: 1.0 GHz disallowed for links connecting internal nodes as indicated by D18F0x1A0[IntLnkRoute].</li><li>2. <b>AM3r2</b>: 0.4-1.0 GHz disallowed for AM3r2 package. 0.2 GHz supported only as boot frequency to first warm reset; 0.2 GHz disallowed as operational frequency.</li></ol> | Bits    | Link Frequency | Bits | Link Frequency | 00h | 0.2 GHz. <sup>2</sup> | 10h | Reserved | 01h | Reserved | 11h | 2.8 GHz. | 02h | 0.4 GHz. <sup>2</sup> | 12h | 3.0 GHz. | 03h | Reserved | 13h | 3.2 GHz. | 04h | 0.6 GHz. <sup>2</sup> | 14h | Reserved | 05h | 0.8 GHz. <sup>2</sup> | 15h | Reserved | 06h | 1.0 GHz. <sup>1, 2</sup> | 1Fh-16h | Reserved | 07h | 1.2 GHz. |  |  | 08h | 1.4 GHz. |  |  | 09h | 1.6 GHz. |  |  | 0Ah | 1.8 GHz. |  |  | 0Bh | 2.0 GHz. |  |  | 0Ch | 2.2 GHz. <sup>2</sup> |  |  | 0Dh | 2.4 GHz. |  |  | 0Eh | 2.6 GHz. <sup>2</sup> |  |  | 0Fh | Reserved. |  |  |

### D18F0x[EC,CC,AC,8C] Link Feature Capability

See 2.12.1.3.1 [Link Specific Registers]. This register is derived from the link feature capability register defined in the link specification. Unless otherwise specified: 0=The feature is not supported; 1=The feature is supported.

Table 132: Register Mapping for D18F0x[EC,CC,AC,8C]

| Register | Function |
|----------|----------|
| D18F0x8C | Link 0   |
| D18F0xAC | Link 1   |
| D18F0xCC | Link 2   |
| D18F0xEC | Link 3   |

| Bits  | Description  |
|-------|--|
| 31:10 | Reserved.  |
| 9     | <b>UpstrCfgCap: upstream configuration capable.</b> Read-only. Reset: 0.   |
| 8     | <b>ExtRegSet: extended register set.</b> Read-only. Reset: 0.  |
| 7:6   | Reserved.  |
| 5     | <b>UnitIdReOrderDis: UnitID reorder disable.</b> Read-write. Read-only. Reset: 0. 1=Upstream reordering for different UnitIDs is not supported; i.e., all upstream packets are ordered as if they have the same UnitID. 0=Reordering based on UnitID is supported. |
| 4     | <b>64BitAddr: 64-bit link addressing.</b> Read-only. Reset: 1.   |
| 3     | <b>ExtCTLReqd: extended CTL required.</b> Read-only. Reset: 0.   |
| 2     | <b>CrcTstMode: CRC test mode.</b> Read-only. Reset: 0.   |
| 1     | <b>LdtStopMode: LDTSTOP_L supported.</b> Read-only. Reset: 1.  |
| 0     | <b>IsocMode: isochronous flow control mode.</b> Read-only. Reset: 1.   |

### D18F0x[F0,D0,B0,90] Link Base Channel Buffer Count

Read-write; Reset-applied.

Table 133: Register Mapping for D18F0x[F0,D0,B0,90]

| Register | Function |
|----------|----------|
| D18F0x90 | Link 0   |
| D18F0xB0 | Link 1   |
| D18F0xD0 | Link 2   |
| D18F0xF0 | Link 3   |

D18F0x[F0,D0,B0,90] and D18F0x[F4,D4,B4,94] specify the *hard-allocated* link flow-control buffer counts in each virtual channel available to the transmitter at the other end of the link; it also provides the *free buffers* that may be used by any of the virtual channels, as needed. Base channel buffers are specified in D18F0x[F0,D0,B0,90]; isochronous buffer counts (if in IFCM) are specified in D18F0x[F4,D4,B4,94]. For all fields that specify buffer counts in D18F0x[F0,D0,B0,90] and D18F0x[F4,D4,B4,94], if the link is ganged, then the number of buffers allocated is 2 times the value of the field; If the link is unganged, then the number of buffers allocated is the value of the field. See 2.12.1.3.1 [Link Specific Registers]. See section 2.12.1.3.2 [Unused Links].

The cold or warm reset value is determined by whether the link initializes, whether the link is IO/coherent, whether the link is ganged/unganged, and whether the settings are locked by LockBc.

```
IF (LinkConnected & IoLink & LockBc) THEN Cold reset: 0285_0292h.
ELSEIF (LinkConnected & IoLink & ~LockBc) THEN Reset: 0285_0292h.
ELSEIF (LinkConnected & ~IoLink & LockBc) THEN Cold reset: 028A_9944h.
ELSEIF (LinkConnected & ~IoLink & ~LockBc) THEN Reset: 028A_9944h.
ELSE Reset: X. ENDIF. //Link not connected
```

The hard-allocated buffer counts are transmitted to the device at the other end of the link in buffer release messages after link initialization. The remaining buffers are held in the free list (specified by FreeData and FreeCmd) used to optimize buffer usage. When a transaction is received, if a free-list buffer is available, it is used for storage instead of one of the hard allocated buffers; as a result, a buffer release (for one of the hard

allocated buffers used by the incoming request) can be immediately sent back to the device at the other end of the link without waiting for the transaction to be routed beyond the flow-control buffers.

Buffer allocation rules:

- The total number of command buffers allocated in the base and isochronous registers of a link cannot exceed 32 (64 buffers) if ganged or 32 (32 buffers) if unganged:
  - $(D18F0x[F0,D0,B0,90][NpReqCmd] + D18F0x[F0,D0,B0,90][PReq] + D18F0x[F0,D0,B0,90][RspCmd] + D18F0x[F0,D0,B0,90][ProbeCmd] + D18F0x[F0,D0,B0,90][FreeCmd] + D18F0x[F4,D4,B4,94][IsocNpReqCmd] + D18F0x[F4,D4,B4,94][IsocPReq] + D18F0x[F4,D4,B4,94][IsocRspCmd]) \leq 32$ .
- The total number of data buffers allocated in the base and isochronous registers of a link cannot exceed 8 (16 buffers) if ganged or 8 (8 buffers) if unganged:
  - $(D18F0x[F0,D0,B0,90][NpReqData] + D18F0x[F0,D0,B0,90][RspData] + D18F0x[F0,D0,B0,90][PReq] + D18F0x[F0,D0,B0,90][FreeData] + D18F0x[F4,D4,B4,94][IsocPReq] + D18F0x[F4,D4,B4,94][IsocNpReqData] + D18F0x[F4,D4,B4,94][IsocRspData]) \leq 8$ .
- The total number of hard allocated command buffers cannot exceed 24 (48 buffers) if ganged or 24 (24 buffers) if unganged.
  - $(D18F0x[F0,D0,B0,90][ProbeCmd] + D18F0x[F0,D0,B0,90][RspCmd] + D18F0x[F0,D0,B0,90][PReq] + D18F0x[F0,D0,B0,90][NpReqCmd] + D18F0x[F4,D4,B4,94][IsocRspCmd] + D18F0x[F4,D4,B4,94][IsocRspCmd] + D18F0x[F4,D4,B4,94][IsocPReq] + D18F0x[F4,D4,B4,94][IsocNpReqCmd]) \leq 24$ .
- BIOS must set up non-zero counts (and adjust the base channel counts accordingly) prior to enabling IFCM.
- If an IOMMU is present in the system,  $D18F0x[F4,D4,B4,94][IsocNpReqCmd]$  must be non-zero for all enabled links.

See 2.9.3.2.5.1 [Recommended Buffer Count Settings Overview].

| 11:8  | <b>RspCmd: response command buffer count.</b> BIOS: <a href="#">Table 134</a> .   |
| 7:5   | <b>PReq: posted request command and data buffer count.</b> Specifies the number of posted command and posted data buffers allocated. BIOS: <a href="#">Table 134</a> .  |
| 4:0   | <b>NpReqCmd: non-posted request command buffer count.</b> BIOS: <a href="#">Table 134</a> .   |

#### **D18F0x[F4,D4,B4,94] Link Isochronous Channel Buffer Count**

Read-write; Reset-applied. See [D18F0x\[F0,D0,B0,90\]](#).

Table 135: [Register Mapping](#) for [D18F0x\[F4,D4,B4,94\]](#)

| Register | Function |
|----------|----------|
| D18F0x94 | Link 0   |
| D18F0xB4 | Link 1   |
| D18F0xD4 | Link 2   |
| D18F0xF4 | Link 3   |

The cold or warm reset is determined by whether the link initializes and whether the settings are locked by LockBc.

```
IF (LinkConnected && D18F0x[F0,D0,B0,90][LockBc]) THEN Cold reset: 0000_0000h.
ELSEIF (LinkConnected && ~D18F0x[F0,D0,B0,90][LockBc]) THEN Reset: 0000_0000h.
ELSE Reset: X. ENDIF. //Link not connected
```

| 31:16 | Reserved.   |

|      |  |
|------|--|
| 15:1 | <b>FreqCapExt: link frequency capability extension.</b> See: <a href="#">D18F0x[E8,C8,A8,88][LnkFreqCap]</a> . |
| 0    | <b>Freq[4]: link frequency.</b> See: <a href="#">D18F0x[E8,C8,A8,88][Freq[3:0]]</a> .                          |

### D18F0x[11C,118,114,110] Link Clumping Enable

Reset: 0000\_0000h. [D18F0x\[11C,118,114,110\]](#) are associated with the whole link if it is ganged or sublink 0 if it is unganged; [D18F0x\[12C,128,124,120\]](#) are associated with sublink 1 if the link is unganged. If the node does not support a link, then the corresponding register addresses become reserved.

Table 138: [Register Mapping](#) for [D18F0x\[11C,118,114,110\]](#)

| Register  | Function |
|-----------|----------|
| D18F0x110 | Link 0   |
| D18F0x114 | Link 1   |
| D18F0x118 | Link 2   |
| D18F0x11C | Link 3   |

These registers specify how UnitIDs of upstream non-posted requests may be clumped per the link specification. The processor does not clump requests that it generates in the downstream direction.

| Bits | Description   |
|------|---|
| 31:2 | <b>ClumpEn.</b> Read-write. Each bit of this register corresponds to a link UnitID number. E.g., bit 2 corresponds to UnitID 02h, etc. 1=The specified UnitID is ordered in the same group as the specified UnitID - 1. For example if this register is programmed to 0000_00C0h, then UnitIDs 7h, 6h, and 5h are all ordered as if they are part of the same UnitID. This is used to allow more than 32 tags to be assigned to a single stream for the purposes of ordering. |
| 1    | Reserved.   |
| 0    | Reserved.   |

### D18F0x[12C,128,124,120] Sublink 1 Clumping Enable

Reset: 0000\_0000h. See [D18F0x\[11C,118,114,110\]](#).

Table 139: [Register Mapping](#) for [D18F0x\[12C,128,124,120\]](#)

| Register  | Function |
|-----------|----------|
| D18F0x120 | Link 0   |
| D18F0x124 | Link 1   |
| D18F0x128 | Link 2   |
| D18F0x12C | Link 3   |

| Bits | Description   |
|------|---|
| 31:0 | See: <a href="#">D18F0x[11C,118,114,110]</a> . If a link is ganged or not supported, then the corresponding register in this group is reserved. |

**D18F0x[14C:130] Link Retry**

Table 140: Register Mapping for D18F0x[14C:130]

| Register  | Function         |
|-----------|------------------|
| D18F0x130 | Link 0 Sublink 0 |
| D18F0x134 | Link 1 Sublink 0 |
| D18F0x138 | Link 2 Sublink 0 |
| D18F0x13C | Link 3 Sublink 0 |
| D18F0x140 | Link 0 Sublink 1 |
| D18F0x144 | Link 1 Sublink 1 |
| D18F0x148 | Link 2 Sublink 1 |
| D18F0x14C | Link 3 Sublink 1 |

If a link is ganged, then the sublink 0 retry register specifies the link retry function and the sublink 1 retry register is reserved. If a link is not supported by the node, then both the sublink 0 and sublink 1 retry registers are reserved. These registers are reserved if **D18F3xE8[LnkRtryCap]=0**.

| Bits  | Description   |
|-------|---|
| 31:16 | <b>RetryCount</b> . Read-write; updated-by-hardware. Cold reset: 0. This is a 16-bit counter that is incremented by hardware. The counter is incremented in two ways, (1) the counter increments once for each failed training attempt and (2) the counter increments once for each packet error that causes a retry attempt. If the counter value is FFFFh it increments to 0000h and the RetryCountRollover bit is set. RetryCount is not incremented for retries initiated by other devices, only for errors detected by the node. |
| 15:13 | Reserved.   |
| 12    | <b>DataCorruptOut: sent corrupted data</b> . Read; write-1-to-clear; set-by-hardware. Cold reset: 0. 1=Data sent on the link was marked with Data Error to indicate that it is known to be corrupted.   |
| 11    | <b>InitFail</b> . Read; write-1-to-clear; set-by-hardware. Cold reset: 0. 1=Initialization sequence failed on a link reconnect.   |
| 10    | <b>StompedPktDet: stomped packet detected by receiver</b> . Read; write-1-to-clear; set-by-hardware. Cold reset: 0.   |
| 9     | <b>RetryCountRollover</b> . Read; write-1-to-clear; set-by-hardware. Cold reset: 0. See RetryCount.   |
| 8     | <b>RetryErrorDet: retry error detected</b> . Read; write-1-to-clear; set-by-hardware. Cold reset: 0. 1=A retry was initiated in one of the ways listed in RetryCount.   |
| 7:6   | <b>ShortRetryAttempts</b> . Read-write. Reset: 11b. This specifies the number of short retry attempts when operating at a Gen3 link frequency; after exceeding this value, long retries are attempted until the max count specified by <b>D18F0x150 [Link Global Retry Control][TotalRetryAttempts]</b> is exceeded. The retry attempt counter is not incremented for retries initiated by other devices, only for errors detected by the node. This field is ignored when operating at Gen1 link frequencies.                        |
| 5:4   | Reserved.   |
| 3     | <b>DisRetryDataError: disable link retry on data packet error</b> . Read-write. Reset: 0. 1=The node does not initiate the retry sequence if an error is detected on a data packet; Data packets are acknowledged even if there is a CRC error. This is intended to support debug modes in which errors are detected but allowed to propagate through the crossbar in order to allow logging of error data patterns in trace mode.  |

|   |   |
|---|---|
| 2 | <b>DisRetryAnyError: disable link retry on any packet error.</b> Read-write. Reset: 0. 1=The node does not initiate the retry sequence if an error is detected; Packets are acknowledged even if there is a CRC error. This is intended to support debug modes in which errors are detected but allowed to propagate through the crossbar in order to allow logging of error data patterns in trace mode. |
| 1 | <b>ForceRetryError.</b> Read-write; cleared-by-hardware. Cleared by hardware once the error has been injected onto the link. Reset: 0. This bit may be used by diagnostic software to test the error detection and retry logic of the link. 1=Forces a CRC error in one packet from the transmitter. See <a href="#">D18F0x150 [Link Global Retry Control]</a> [MultRetryErr].                            |
| 0 | <b>RetryModeEnable.</b> Read-write; reset-applied. Cold reset: 0. 1=Place the link in error retry mode when reconnecting after the next warm reset. See <a href="#">Table 112</a> .   |

### D18F0x150 Link Global Retry Control

This register is reserved if [D18F3xE8\[LnkRtryCap\]](#)=0. All fields of this register are expected to be programmed the same in all nodes of the system (except ForceErrType and MultRetryErr).

| Bits  | Description   |
|-------|---|
| 31:19 | Reserved.   |
| 18:16 | <b>TotalRetryAttempts.</b> Read-write. Cold reset: 111b. BIOS: This register should be programmed to values of 1 or greater. Specifies the total number of retry attempts (short and long) allowed on any link before the link is considered to have failed. When operating at Gen3 link frequencies, short retry attempts are limited by <a href="#">D18F0x[14C:130] [Link Retry]</a> [ShortRetryAttempts]; the remaining are long retry attempts. The link is determined to have failed after TotalRetryAttempts + 1 errors; e.g., if TotalRetryAttempts=7, then the link is determined to have failed as a result of the 8 errors. The retry attempt counter for a link is incremented each time <a href="#">D18F0x[14C:130][RetryCount]</a> for that link is incremented. |
| 15:14 | Reserved.   |
| 13    | <b>HtRetryCrcDatInsDynEn: link retry CRC data insertion enable.</b> Read-write. Cold reset: 0. BIOS: 1. 1=Enables dynamic mode for CRC insertion in data packets on a coherent link. In this mode, the transmitter follows the insertion policy defined by HtRetryCrcDatIns[2:0] for a link which is close to idle; however, it inserts fewer CRC cells as the link becomes busy. Must be modified only when all links are operating at Gen1 frequency.   |
| 12    | <b>HtRetryCrcCmdPackDynEn: link retry CRC command packet dynamic mode enable.</b> Read-write. Cold reset: 0. BIOS: 1. 1=Enables dynamic mode for CRC command packing on a coherent link with retry enabled. In this mode, command packing is suspended when a link is not busy. This field is valid only when HtRetryCrcCmdPack==1. Must be modified only when all links are operating at Gen1 frequency.   |

| 11:9      | <p><b>HtRetryCrcDatIns: link retry CRC data insertion.</b> Read-write. Cold reset: 000b. BIOS: 100b. Specifies insertion of additional CRC cells in a data packet over coherent link. A data packet is defined as a data command header followed by at most 4 data beats (beat 0 through beat 3) of 16 bytes each with a data packet CRC at the end. This field must be modified only when all links are operating at Gen1 frequency.</p> <p>IF (<a href="#">LinkFreq</a>≤<a href="#">NBCOF</a>) THEN</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>000b</td><td>No additional CRC insertion</td></tr> <tr> <td>001b</td><td>CRC insertion after data beat 0</td></tr> <tr> <td>010b</td><td>CRC insertion after cmd header and after data beat 0</td></tr> <tr> <td>011b</td><td>CRC insertion after cmd header, data beat 0 and data beat 1</td></tr> <tr> <td>100b</td><td>CRC insertion after cmd header, data beat 0, data beat 1 and data beat 2</td></tr> <tr> <td>111b-101b</td><td>Reserved</td></tr> </table> <p>ELSE // (<a href="#">LinkFreq</a>&gt;<a href="#">NBCOF</a>)</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>000b</td><td>No additional CRC insertion</td></tr> <tr> <td>100b-001b</td><td>CRC insertion after cmd header and after data beat 0</td></tr> <tr> <td>111b-101b</td><td>Reserved</td></tr> </table> <p>ELSE.</p> | Bits | Description | 000b | No additional CRC insertion   | 001b | CRC insertion after data beat 0   | 010b | CRC insertion after cmd header and after data beat 0  | 011b | CRC insertion after cmd header, data beat 0 and data beat 1  | 100b | CRC insertion after cmd header, data beat 0, data beat 1 and data beat 2 | 111b-101b | Reserved | Bits | Description | 000b | No additional CRC insertion | 100b-001b | CRC insertion after cmd header and after data beat 0 | 111b-101b | Reserved |

| 15:11 | Reserved.  |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 10:8  | <b>DstNode: coherent link distribution destination node.</b> Read-write. For cHTReqDistEn and cHTRspDistEn, DstNode[2:0] specifies the destination node for which coherent link traffic should be distributed. For cHTPrbDistEn, all probes originating from the local node are distributed irrespective of the value of DstNode[2:0]. Packets specified by cHTReqDistEn, cHTRspDistEn, and cHTPrbDistEn that are destined for DstNode are distributed between links specified by DstLnk in approximately a round-robin fashion.   |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 7:4   | Reserved.  |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 3     | <b>cHTVicDistMode: cHT VicBlk and VicBlkClean packet distribution mode.</b> Read-write. 1=Route cHT VicBlk and VicBlkClean packets that are destined to DstNode across the link specified by DstLnk; DstLnk must specify only 1 link and must be ganged (sublink 0); If the coherent link pair distribution widget is enabled then DstLnk must be the master link; can be enabled when coherent link pair distribution is enabled or disabled; cHTReqDistEn=1 enables VicBlk and VicBlkClean distribution and is recommended to be 1; cHTRspDistEn=1 enables TgtDone and SrcDone for VicBlk and VicBlkClean and is recommended to be 1; cHTPrbDistEn must not be enabled. See 2.9.3.2.4.3 [Victim Distribution Mode].  |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 2     | <b>cHTPrbDistEn: coherent link probe distribution enable.</b> Read-write. 1=Enable coherent link traffic distribution for the probe virtual channel; the probes affected by this bit are limited to those sourced from the local node (as opposed to being forwarded from another node). See cHTVicDistMode.   |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 1     | <b>cHTRspDistEn: coherent link response distribution enable.</b> Read-write. 1=Enable coherent link traffic distribution for the response virtual channel.; the responses affected by this bit are limited to responses to the request types listed for cHTReqDistEn and which are sourced from the local node (as opposed to being forwarded from another node). See cHTVicDistMode.  |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |
| 0     | <b>cHTReqDistEn: coherent link request distribution enable.</b> Read-write. 1=Enable coherent link traffic distribution for the request virtual channel; the requests affected by this bit are limited to cache block transactions and directed probes which are sourced from the local node (as opposed to being forwarded from another node). See cHTVicDistMode.  |     |                   |     |             |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |     |                   |

**D18F0x168 Extended Link Transaction Control**

Reset: 0000\_0000h.

| Bits  | Description  |
|-------|--|
| 31:11 | Reserved.  |
| 10    | <b>DisNcHtCmdThrottle: disable IO link command throttling.</b> Read-write. 0=The node limits generation of the first DWORD of link-defined commands to no more than one every four DWORDs of link bandwidth. If, for example, a 2-DWORD command is transmitted by the node, and there is no data that follows, then the node sends at least 2 DWORDs of NOPs (possibly including buffer release credits) before generating the next command packet. This bit applies to both Gen1 and Gen3 frequencies and protocols. This bit does not affect coherent links. Some IO devices may require this bit to be clear. 1=The node does not limit the rate at which commands are generated on IO links. |
| 9:0   | Reserved.  |

**D18F0x16C Link Global Extended Control**

Same-for-all. Further information about these bits can be found in the Gen3 link specification.

| Bits  | Description  |      |             |      |             |      |           |      |        |      |        |      |        |      |        |      |         |      |        |      |         |
|-------|--|------|-------------|------|-------------|------|-----------|------|--------|------|--------|------|--------|------|--------|------|---------|------|--------|------|---------|
| 31:23 | Reserved.  |      |             |      |             |      |           |      |        |      |        |      |        |      |        |      |         |      |        |      |         |
| 22:17 | <b>FullT0Time: full T0 time.</b> Read-write. Reset: 3Ah. BIOS: 33h. Specifies the amount of time to spend in training 0 following a warm reset, frequency change, or when the full T0 training period is invoked due to expiration of the idle timer as described in D18F0x16C[ForceFullT0]. Encodings are the same as T0Time. BIOS should set FullT0Time according to the maximum T0 training time requirement for the link’s far-side receiver phase recovery time as determined by characterization.  |      |             |      |             |      |           |      |        |      |        |      |        |      |        |      |         |      |        |      |         |
| 16    | <b>ImmUpdate: immediate update.</b> Cold reset: 0. Read-write. Many of the link phy registers, accessed through D18F4x1[98,90,88,80], control electrical parameters that are unsafe to change while the link is operational; so the updates to these registers are normally withheld until the link is disconnected. However, under some (testing and characterization) circumstances, it is preferable to allow these changes to occur immediately, while the link is operational. ImmUpdate provides this option. 0=Writes to most of the link phy registers do not take effect in the link phy until the next LDTSTOP_L or warm reset disconnect. Reads from a link phy register after a write return the current value not the value pending until the link disconnects and reconnects. 1=Writes to the link phy registers are passed to the phy immediately. Reads always returns the value from the most recent write. |      |             |      |             |      |           |      |        |      |        |      |        |      |        |      |         |      |        |      |         |
| 15:13 | <b>ForceFullT0: force full T0 training time.</b> Read-write. Cold reset: 000b. BIOS: IF (D18F0x[18C:170][LS2En] is set for any link) THEN 111b ELSE 000b ENDIF. This specifies the period of time that the link can be disconnected for an LDTSTOP_L before the full T0 training period is invoked. The time is measured approximately from the assertion of LDTSTOP_L until training 0 is about to start after LDTSTOP_L deassertion. If less than the specified time has expired, then training 0 specified by T0Time is used. <table><tr><th>Bits</th><th>Description</th><th>Bits</th><th>Description</th></tr><tr><td>000b</td><td>Disabled.</td><td>100b</td><td>3.2 ms</td></tr><tr><td>001b</td><td>400 us</td><td>101b</td><td>6.4 ms</td></tr><tr><td>010b</td><td>800 us</td><td>110b</td><td>12.8 ms</td></tr><tr><td>011b</td><td>1.6 ms</td><td>111b</td><td>25.6 ms</td></tr></table>                         | Bits | Description | Bits | Description | 000b | Disabled. | 100b | 3.2 ms | 001b | 400 us | 101b | 6.4 ms | 010b | 800 us | 110b | 12.8 ms | 011b | 1.6 ms | 111b | 25.6 ms |

### **D18F0x[18C:170] Link Extended Control**

These registers provide control for each link. They are mapped to the links as follows:

Table 141: [Register Mapping](#) for [D18F0x\[18C:170\]](#)

| Register  | Function         |
|-----------|------------------|
| D18F0x170 | Link 0 Sublink 0 |
| D18F0x174 | Link 1 Sublink 0 |
| D18F0x178 | Link 2 Sublink 0 |
| D18F0x17C | Link 3 Sublink 0 |
| D18F0x180 | Link 0 Sublink 1 |
| D18F0x184 | Link 1 Sublink 1 |
| D18F0x188 | Link 2 Sublink 1 |
| D18F0x18C | Link 3 Sublink 1 |

Visibility of these sublink 1 registers is as specified through Ganged (bit 0) of the sublink 0 registers. If a link is ganged, only the register for sublink 0 of that link is visible and it applies to the whole link. Further information about these bits can be found in the Gen3 link specification.

| 13:12 | <p><b>LaneSel: lanes select.</b> Read-write. Cold reset: 00b. This field only exists in the sublink 0 registers; in the sublink 1 registers, these bits are reserved. For unganged links, they apply to both sublinks. This field specifies how receive (RX) lanes are translated into transmit (TX) lanes for links that are in ILM. The translation varies with link width. Given the RX order specified below, the TX order varies with LaneSel as follows:</p> <table><tr><th>Bits</th><th>16-bit link</th><th>8-bit link</th></tr><tr><td></td><td>RX={CTL1, CAD[15:8], CTL0, CAD[7:0]}</td><td>RX={CTL0, CAD[7:0]}</td></tr><tr><td>00b</td><td>Same as RX.</td><td>Same as RX</td></tr><tr><td>01b</td><td>TX={CAD[12:8], CTL0, CAD[7:0], CTL1, CAD[15:13]}</td><td>TX={CAD[6:0], CTL0, CAD[7]}</td></tr><tr><td>10b</td><td>TX={CTL0, CAD[7:0], CTL1, CAD[15:8]}</td><td>TX={CAD[4:0], CTL0, CAD[7:5]}</td></tr><tr><td>11b</td><td>TX={CAD[4:0], CTL1, CAD[15:8], CTL0, CAD[7:5]}</td><td>TX={CAD[2:0], CTL0, CAD[7:3]}</td></tr></table><br><table><tr><th>Bits</th><th>4-bit link</th><th>2-bit link</th></tr><tr><td></td><td>RX = {CTL0, CAD[3:0]}</td><td>RX = {CTL0, CAD[1:0]}</td></tr><tr><td>00b</td><td>Same as RX.</td><td>Same as RX.</td></tr><tr><td>01b</td><td>TX={CAD[3:0], CTL0}</td><td>TX={CAD[1:0], CTL0}</td></tr><tr><td>10b</td><td>TX={CAD[2:0], CTL0, CAD[3]}</td><td>TX={CAD[0], CTL0, CAD[1]}</td></tr><tr><td>11b</td><td>TX={CAD[1:0], CTL0, CAD[3:2]}</td><td>Reserved</td></tr></table> <p>Values 01b and 11b are not useful at Gen1 frequencies because the link cannot be trained unless the CTL lanes line up.</p> <p>In BIST mode on 16-bit links, LaneSel[1] selects which sublink is received by the BIST engine. 0=sublink 0, 1=sublink 1; LaneSel[1:0] also causes the receive path of the BIST engine to reverse the translation for 8-bit or smaller links.</p> | Bits                          | 16-bit link | 8-bit link |  | RX={CTL1, CAD[15:8], CTL0, CAD[7:0]} | RX={CTL0, CAD[7:0]} | 00b | Same as RX. | Same as RX | 01b | TX={CAD[12:8], CTL0, CAD[7:0], CTL1, CAD[15:13]} | TX={CAD[6:0], CTL0, CAD[7]} | 10b | TX={CTL0, CAD[7:0], CTL1, CAD[15:8]} | TX={CAD[4:0], CTL0, CAD[7:5]} | 11b | TX={CAD[4:0], CTL1, CAD[15:8], CTL0, CAD[7:5]} | TX={CAD[2:0], CTL0, CAD[7:3]} | Bits | 4-bit link | 2-bit link |  | RX = {CTL0, CAD[3:0]} | RX = {CTL0, CAD[1:0]} | 00b | Same as RX. | Same as RX. | 01b | TX={CAD[3:0], CTL0} | TX={CAD[1:0], CTL0} | 10b | TX={CAD[2:0], CTL0, CAD[3]} | TX={CAD[0], CTL0, CAD[1]} | 11b | TX={CAD[1:0], CTL0, CAD[3:2]} | Reserved |

|     |   |
|-----|---|
| 3   | <b>ScrambleEn: scrambling enable.</b> Read-write. Cold reset: 0. 1=Scrambling enable. Updates to this bit take effect on warm reset and LDTSTOP. Software must clear this bit when transitioning from Gen3 to Gen1 protocol. See <a href="#">Table 112</a> .  |
| 2:1 | Reserved.   |
| 0   | <b>Ganged.</b> Read-write; read-only 1 if the bit corresponding to the link in <a href="#">D18F3xE8[UnGangEn]</a> is 0. 0=The link is unganged; this register is visible for both sublinks. 1=The link is ganged; only the sublink 0 register is visible. This value is initialized after a cold reset, based on the ganging state determined by hardware (see <a href="#">2.12.1.1 [Ganging And Unganging]</a> ). Writes to this bit take effect on the next warm reset; reads reflect the last value written (rather than the current state of the link). This bit only exists in the sublink 0 registers. BIOS: see <a href="#">2.12.1.5 [Link Mapping Between Package and Node]</a> . |

### D18F0x1A0 Link Initialization Status

### D18F0x1DC Core Enable

Reset: 0000\_0000h.

| Bits | Description |
|------|-------------|
| 31:8 | Reserved.   |

|     |   |
|-----|---|
| 7:1 | <b>CpuEn: core enable.</b> Read-write. This field is used to enable each of the cores after a reset. 1=Enable the core to start fetching and executing code from the boot vector. [1]: Core 1 enable; ...; [N]: Core N enable. The most significant bit N is indicated by CpuCoreNum, as defined in section 2.4.3 [Processor Cores and Downcoring]. All bits greater than N are reserved. |
| 0   | Reserved.   |

### D18F0x1E0 Coherent Link Pair Traffic Distribution

Reset: 0000\_0000h. See 2.9.3.2.4 [Link Traffic Distribution] for details about link traffic distribution.

### 3.4 Device [1F:18]h Function 1 Configuration Registers

See 3.1 [Register Descriptions and Mnemonics]. See 2.8 [Configuration Space].

#### D18F1x00 Device/Vendor ID

| Bits  | Description  |
|-------|--|
| 31:16 | <b>DeviceID: device ID.</b> Read-only. Value: 1601h. |
| 15:0  | <b>VendorID: vendor ID.</b> Read-only. Value: 1022h. |

**D18F1x08 Class Code/Revision ID**

| Bits | Description  |
|------|--|
| 31:8 | <b>ClassCode</b> . Read-only. Value: 060000h. Provides the host bridge class code as defined in the PCI specification. |
| 7:0  | <b>RevID: revision ID</b> . Read-only. Value: 00h. Processor revision. 00h=A0.   |

**D18F1x0C Header Type**

Reset: 0080\_0000h.

| Bits | Description   |
|------|---|
| 31:0 | <b>HeaderTypeReg</b> . Read-only. These bits are fixed at their default values. The header type field indicates that there are multiple functions present in this device. |

**D18F1x[17C:140,7C:40] DRAM Base/Limit**

The following 8 sets of registers specify the destination node of DRAM address ranges:

Table 142: Register Mapping for D18F1x[17C:140,7C:40]

| Function | Base Low | Limit Low | Base High | Limit High |
|----------|----------|-----------|-----------|------------|
| Range 0  | D18F1x40 | D18F1x44  | D18F1x140 | D18F1x144  |
| Range 1  | D18F1x48 | D18F1x4C  | D18F1x148 | D18F1x14C  |
| Range 2  | D18F1x50 | D18F1x54  | D18F1x150 | D18F1x154  |
| Range 3  | D18F1x58 | D18F1x5C  | D18F1x158 | D18F1x15C  |
| Range 4  | D18F1x60 | D18F1x64  | D18F1x160 | D18F1x164  |
| Range 5  | D18F1x68 | D18F1x6C  | D18F1x168 | D18F1x16C  |
| Range 6  | D18F1x70 | D18F1x74  | D18F1x170 | D18F1x174  |
| Range 7  | D18F1x78 | D18F1x7C  | D18F1x178 | D18F1x17C  |

F1x0XX registers provide the low address bits and F1x1XX registers provide the high address bits. Transaction addresses that are within the specified base/limit range are routed to the DstNode. See 2.9.3 [NB Routing].

DRAM mapping rules:

- Transaction addresses are within the defined range if:  
 $\{\text{DramBase}[47:24], 00\_0000\text{h}\} \leq \text{address}[47:0] \leq \{\text{DramLimit}[47:24], \text{FF\_FFFFh}\}$ .
- DRAM regions must not overlap each other.
- Accesses to addresses that map to both DRAM, as specified by the DRAM base and limit registers (F1x[1, 0][7C:40]), and MMIO, as specified by D18F1x[1CC:180,BC:80], are routed to MMIO only.
- Programming of the DRAM address maps must be consistent with the Memory-Type Range Registers (MTRRs) and the top of memory registers, MSRC001\_001A and MSRC001\_001D. CPU accesses only hit within the DRAM address maps if the corresponding MTRR is of type DRAM. Accesses from IO links are routed based on the DRAM base and limit registers (F1x[1, 0][7C:40]) only.
- The appropriate RE or WE bit(s) must be set.
- See 2.9.3.1.1 [DRAM and MMIO Memory Space].

**Hoisting.** When memory hoisting is enabled in a node via D18F1xF0[DramHoleValid], the corresponding

BaseAddr/LimitAddr should be configured to account for the memory hoisted above the hole. See [2.10.7 \[Memory Hoisting\]](#).

**Node interleave.** DRAM may be mapped as continuous regions for each node or it may be interleaved between nodes. See [2.10.6.3 \[Node Interleaving\]](#).

#### D18F1x[78,70,68,60,58,50,48,40] DRAM Base Low

IF (D18F2x118[LockDramCfg]) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0000\_0000h.

| Range 8  | D18F1x1A0     | D18F1x1A4      | D18F1x1C0            |
| Range 9  | D18F1x1A8     | D18F1x1AC      | D18F1x1C4            |
| Range 10 | D18F1x1B0     | D18F1x1B4      | D18F1x1C8            |
| Range 11 | D18F1x1B8     | D18F1x1BC      | D18F1x1CC            |

Transaction addresses that are within the specified base/limit range are routed to the node specified by DstNode and the link specified by DstLink. See [2.9.3 \[NB Routing\]](#).

.MMIO mapping rules:

- Transaction addresses are within the defined range if:  
 $\{\text{MMIOBase}[47:16], 0000\text{h}\} \leq \text{address}[47:0] \leq \{\text{MMIOLimit}[47:16], \text{FFFFh}\}.$

- MMIO regions must not overlap each other.
- Accesses to addresses that map to both DRAM, as specified by the DRAM base and limit registers (see [D18F1x\[17C:140,7C:40\]](#)), and MMIO, as specified by the memory mapped IO base and limit registers ([F1x\[BC:80\]](#)), are routed to MMIO only.
- Programming of the MMIO address maps must be consistent with the Memory-Type Range Registers (MTRRs) and the top of memory registers, [MSRC001\\_001A](#) and [MSRC001\\_001D](#). CPU accesses only hit within the MMIO address maps if the corresponding MTRR is of type IO. Accesses from IO links are routed based on [D18F1x\[1CC:180,BC:80\]](#).
- The appropriate RE or WE bit(s) must be set. When initializing a base/limit pair, the BIOS must write the limit register before either the RE or WE bit is set. When changing a base/limit pair that is already enabled, the BIOS should clear RE and WE before changing the address range.
- Scenarios in which the address space of multiple MMIO ranges target the same IO device is supported.
- See [2.9.3.1.1 \[DRAM and MMIO Memory Space\]](#).

| D18F1x1B4 | Range 10 |
| D18F1x1BC | Range 11 |

| Bits | Description   |
|------|---|
| 31:8 | <b>MMIOLimit[39:16]: MMIO limit address register bits[39:16].</b> Read-write. Reset: 0. MMIOLimit[47:16] = {D18F1x[1CC:1C0,19C:180][MMIOLimit[47:40]], MMIOLimit[39:16]}.   |
| 7    | <p><b>NP: non-posted.</b> Read-write. Reset: 0. 1=CPU write requests to this MMIO range are passed through the non-posted channel. This may be used to force writes to be non-posted for MMIO regions which map to the legacy ISA/LPC bus, or in conjunction with D18F0x68 [Link Transaction Control][DsNpReqLmt] in order to allow downstream CPU requests to be counted and thereby limited to a specified number. This latter use of the NP bit may be used to avoid loop deadlock scenarios in systems that implement a region in an IO device that reflects downstream accesses back upstream. See the <i>HyperTransport™ IO Link Specification</i> summary of deadlock scenarios for more information.</p> <p>0=CPU writes to this MMIO range use the posted channel. This bit does not affect requests that come from IO links (the virtual channel of the request is specified by the IO request).</p> <p>If two MMIO ranges target the same IO device and the NP bit is set differently in both ranges, unexpected transaction ordering effects are possible. In particular, using PCI- and IO-link-defined producer-consumer semantics, if a producer (e.g., the processor) writes data using a non-posted MMIO range followed by a flag to a posted MMIO range, then it is possible for the device to see the flag updated before the data is updated.</p> |
| 6    | <p><b>DstSubLink: destination sublink.</b> Read-write. Reset: 0. When a link is unganged, this bit specifies the destination sublink of the link specified by the memory mapped IO base and limit registers F1x[BC:80][DstLink]. 0=The destination link is sublink 0. 1=The destination link is sublink 1. If the link is ganged, then this bit must be low.</p>  |

| 5:4  | <b>DstLink: destination link ID.</b> Read-write. Reset: 0. ### D18F1x[DC:C0] IO-Space Base/Limit

The IO-space base and limit registers, [D18F1x\[DC:C0\]](#), specify the mapping from IO addresses to the corresponding node and IO link for transactions resulting from x86-defined IN and OUT instructions. IO address ranges are specified by 4 sets of base/limit registers. The first set is F1xC0 and F1xC4, the second set is F1xC8 and F1xCC, and so forth. Transaction addresses that are within the specified base/limit range are routed to the node specified by DstNode and the link specified by DstLink. See [2.9.3 \[NB Routing\]](#).

IO mapping rules:

- IO-space transaction addresses are within the defined range if:  
 $\{\text{IOBase}[24:12], 000\text{h}\} \leq \text{address} \leq \{\text{IOLimit}[24:12], \text{FFFh}\}$  and as specified by the IE bit; or  
 if the address is in the range specified by the VE bits.
- IO regions must not overlap each other.
- The appropriate RE or WE bit(s) must be set.
- See 2.9.3.1.2 [IO Space].

### D18F1x[D8,D0,C8,C0] IO-Space Base

Table 151: Register Mapping for D18F1x[D8,D0,C8,C0]

| Register | Function |
|----------|----------|
| D18F1xC0 | Range 0  |
| D18F1xC8 | Range 1  |
| D18F1xD0 | Range 2  |
| D18F1xD8 | Range 3  |

| Bits  | Description  |
|-------|--|
| 31:25 | Reserved.  |
| 24:12 | <b>IOBase[24:12]: IO base address register bits[24:12].</b> Read-write. Reset: 0.  |
| 11:6  | Reserved.  |
| 5     | <b>IE: ISA enable.</b> Read-write. Reset: 0. 1=The IO-space address window is limited to the first 256 B of each 1 KB block specified; this only applies to the first 64 KB of IO space. 0=The PCI IO window is not limited in this way.   |
| 4     | <b>VE: VGA enable.</b> Read-write. Reset: 0. 1=Include IO-space transactions targeting the VGA-compatible address space within the IO-space window of this base/limit pair. These include IO accesses in which address bits[9:0] range from 3B0h to 3BBh or 3C0h to 3DFh (address bits[15:10] are not decoded); this only applies to the first 64 KB of IO space; i.e., address bits[24:16] must be low). 0=IO-space transactions targeting VGA-compatible address ranges are not added to the IO-space window. This bit should only ever be set in one register. The MMIO range associated with the VGA enable bit in the PCI specification is NOT included in the VE bit definition; to map this range to an IO link, see D18F1xF4 [VGA Enable]. When D18F1xF4[VE] is set, the state of this bit is ignored. |
| 3:2   | Reserved.  |
| 1     | <b>WE: write enable.</b> Read-write. Reset: 0. 1=Writes to this IO-space address range are enabled.  |
| 0     | <b>RE: read enable.</b> Read-write. Reset: 0. 1=Reads to this IO-space address range are enabled.  |

| 01b   | Link 1   |      |             |     |        |     |        |     |        |     |        |
| 10b   | Link 2   |      |             |     |        |     |        |     |        |     |        |
| 11b   | Link 3   |      |             |     |        |     |        |     |        |     |        |
| 3     | Reserved.  |      |             |     |        |     |        |     |        |     |        |
| 2:0   | <b>DstNode: destination node ID bits.</b> Read-write. Reset: 0. For transactions within the this IO-space range, this field specifies the destination node ID.   |      |             |     |        |     |        |     |        |     |        |

### D18F1x[EC:E0] Configuration Map

D18F1x[EC:E0] specify the mapping from configuration address to the corresponding node and IO link. Configuration address ranges are specified by 4 pairs of base/limit registers. Transaction addresses that are within the specified base/limit range are routed to the node specified by DstNode and the link specified by DstLink. See [2.9.3 \[NB Routing\]](#).

Table 153: [Register Mapping](#) for D18F1x[EC:E0]

| Register | Function |
|----------|----------|
| D18F1xE0 | Range 0  |
| D18F1xE4 | Range 1  |
| D18F1xE8 | Range 2  |
| D18F1xEC | Range 3  |

Configuration space mapping rules:

- Configuration addresses (to “BusNo” and “Device” as specified by [IOCF8 \[IO-Space Configuration Address\]](#) in the case of IO accesses or [2.8 \[Configuration Space\]](#) in the case of MMIO accesses) are within the defined range if:  
 ( {BusNumBase[7:0]} <= BusNo <= {BusNumLimit[7:0]} ) & (DevCmpEn==0); or  
 ( {BusNumBase[4:0]} <= Device <= {BusNumLimit[4:0]} ) & (DevCmpEn==1) & (BusNo == 00h).
- Configuration regions must not overlap each other.
- The appropriate RE or WE bit(s) must be set.
- See [2.9.3.1.3 \[Configuration Space\]](#).

| Bits  | Description  |      |             |     |        |     |        |     |        |     |        |
|-------|--|------|-------------|-----|--------|-----|--------|-----|--------|-----|--------|

| 7     | Reserved.  |      |             |     |        |     |        |     |        |     |        |
| 6:4   | <b>DstNode: destination node ID bits</b> . Read-write. Reset: 0. For transactions within the this configuration-space range, this field specifies the destination node ID.   |      |             |     |        |     |        |     |        |     |        |
| 3     | Reserved.  |      |             |     |        |     |        |     |        |     |        |
| 2     | <b>DevCmpEn: device number compare mode enable</b> . Read-write. Reset: 0. 1=A device number range rather than a bus number range is used to specify the configuration-space window (see above). This is used to enable multiple IO links to be configured as Bus 0.   |      |             |     |        |     |        |     |        |     |        |
| 1     | <b>WE: write enable</b> . Read-write. Reset: 0. 1=Writes to this configuration-space address range are enabled.  |      |             |     |        |     |        |     |        |     |        |
| 0     | <b>RE: read enable</b> . Read-write. Reset: 0. 1=Reads to this configuration-space address range are enabled.  |      |             |     |        |     |        |     |        |     |        |

### D18F1xF0 DRAM Hole Address

IF ([D18F2x118\[LockDramCfg\]](#)) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0000\_0000h. See [2.10.7 \[Memory Hoisting\]](#).

| Bits  | Description  |
|-------|--|
| 31:24 | <b>DramHoleBase[31:24]: DRAM hole base address</b> . Specifies the base address of the IO hole, below the 4GB address level, that is used in memory hoisting. Normally, <code>DramHoleBase &gt;= <a href="#">MSRC001_001A[TOM[31:24]]</a></code> . |
| 23:16 | Reserved.  |
| 15:7  | <b>DramHoleOffset[31:23]: DRAM hole offset address</b> . When <code>DramHoleValid=1</code> , this offset is subtracted from the physical address of certain accesses in forming the normalized address.  |
| 6:2   | Reserved.  |

|   |  |
|---|--|
| 1 | <b>DramMemHoistValid: dram memory hoist valid.</b> 1=Memory hoisting for the address range is enabled in one or more nodes of the coherent fabric. 0=Memory hoisting is not enabled for any node. This bit should be set in all nodes of the coherent fabric if DramHoleValid=1 in any node.                                       |
| 0 | <b>DramHoleValid: dram hole valid.</b> 1=Memory hoisting is enabled in the node. 0=Memory hoisting is not enabled. This bit should be set in the node(s) that own the DRAM address space that is hoisted above the 4 GB address level. If node interleaving is employed, then this should be set in all nodes. See DramHoleOffset. |

### D18F1xF4 VGA Enable

Reset: 0000\_0000h. All these bits are read-write unless Lock is set.

| Bits  | Description  |      |             |     |        |     |        |     |        |     |        |

### D18F1x120 DRAM Base System Address

IF ([D18F2x118\[LockDramCfg\]](#)) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0000\_0000h.

[D18F1x120](#) and [D18F1x124](#) are required to specify the base and limit system address range of the DRAM connected to the local node. DRAM accesses to the local node with physical address [Addr\[47:0\]](#) that are within the following range are directed to the DCTs:

{[DramBaseAddr\[47:27\]](#), 000\_0000h} <= [Addr\[47:0\]](#) <= {[DramLimitAddr\[47:27\]](#), 7FF\_FFFFh};

DRAM accesses to the local node that are outside of this range are master aborted. This range is also used to specify the range of DRAM covered by the scrubber (see [D18F3x58](#) and [D18F3x5C](#)).

DRAM may be mapped as continuous regions for each node or it may be interleaved between nodes. If node interleaving is not invoked, as specified by [DramIntlvEn](#), then the address of the DRAM transaction is normalized before passing it to the DCTs by subtracting [DramBaseAddr](#).

If node interleaving is invoked, then [DramBaseAddr](#) should be zero in all the nodes and [DramLimitAddr](#) should be the top of memory in all nodes. Based on the value of [DramIntlvEn](#), the normalized address to the DCTs is modified to remove the affected address bits between [A\[17:12\]](#); e.g., if 8-node interleave is invoked, then [DramIntlvEn](#) is set to 111b and the normalized address to the DCTs removes [A\[14:12\]](#) to become {[A\[47:15\]](#), [A\[11:0\]](#)}. See [2.10.6.3 \[Node Interleaving\]](#).

|                   |   |
|-------------------|---|
| D18F2x4C_dct[1:0] | 3 |
| D18F2x50_dct[1:0] | 4 |
| D18F2x54_dct[1:0] | 5 |
| D18F2x58_dct[1:0] | 6 |
| D18F2x5C_dct[1:0] | 7 |

These registers along with D18F2x[6C:60]\_dct[1:0] [DRAM CS Mask], translate DRAM request addresses (to a DRAM controller) into DRAM chip selects. Supported DIMM sizes are specified in D18F2x80\_dct[1:0] [DRAM Bank Address Mapping]. For more information on the DRAM controllers, see 2.10 [DRAM Controllers (DCTs)].

For each chip select, there is a DRAM CS Base Address register. For every two chip selects there is a DRAM CS Mask Register. These are associated with DIMM numbers, and CKE signals as follows:

Table 155: DIMM, Chip Select, and Register Mapping

| Base Address Registers   | Mask Register | Logical DIMM <sup>1</sup> |    | Chip Select Pad <sup>2</sup> | CKE Pad <sup>2</sup> |
|--|---------------|---------------------------|----|------------------------------|----------------------|
|  |               | N                         | R4 |                              |                      |
| F2x40  | F2x60         | 0                         | 0  | MEMCS[1:0]_L[0]              | MEMCKE[1:0][0]       |
| F2x44  |               |                           |    | MEMCS[1:0]_L[1]              | MEMCKE[1:0][1]       |

| 1. N=Normal.<br>R4=Four-rank registered DIMM. See D18F2x94_dct[1:0][FourRankRDimm1, FourRankRDimm0]. |               |                           |    |                              |                      |
| 2. See 2.10.2 [DDR Pad to Processor Pin Mapping].  |               |                           |    |                              |                      |

The DRAM controller operates on the normalized physical address of the DRAM request. The normalized physical address includes all of the address bits that are supported by a DRAM controller. See 2.9 [Northbridge (NB)].

Each base address register specifies the starting normalized address of the block of memory associated with the chip select. Each mask register specifies the additional address bits that are consumed by the block of memory associated with the chip selects. If both chip selects of a DIMM are used, they must be the same size; in this case, a single mask register covers the address space consumed by both chip selects.

Lower-order address bits are provided in the base address and mask registers, as well. These allow memory to be interleaved between chip selects, such that contiguous physical addresses map to the same DRAM page of multiple chip selects. See 2.10.6.1 [Chip Select Interleaving]. The hardware supports the use of lower-order address bits to interleave chip selects if (1) the each chip select of the memory system spans the same amount of memory and (2) the number of chip selects of the memory system is a power of two.

System BIOS is required to assign the largest DIMM chip-select range to the lowest normalized address of the DRAM controller. As addresses increase, the chip-select size is required to remain constant or decrease. This is necessary to keep DIMM chip-select banks on aligned address boundaries, regardless as to the amount of address space covered by each chip select.

For each normalized address for requests that enters a DRAM controller, a ChipSelect[i] is asserted if:

```
CSEnable[i] &
( { (InputAddr[38:27] & ~AddrMask[i][38:27]),
    (InputAddr[21:13] & ~AddrMask[i][21:13]) } ==
  { (BaseAddr[i][38:27] & ~AddrMask[i][38:27]),
    (BaseAddr[i][21:13] & ~AddrMask[i][21:13]) } );
```

| Bits  | Description  |
|-------|--|
| 31    | Reserved.  |
| 30:19 | <b>BaseAddr[38:27]: normalized physical base address bits [38:27].</b>   |
| 18:14 | Reserved.  |
| 13:5  | <b>BaseAddr[21:13]: normalized physical base address bits [21:13].</b>   |
| 4     | Reserved.  |
| 3     | <b>OnDimmMirror: on-DIMM mirroring (ODM) enabled.</b> BIOS: <a href="#">RankMap</a> . 1=Address and bank bits are swapped by hardware for MRS commands sent to this chip select. This mode accounts for routing on the DIMM. Hardware bit swapping does not occur for commands sent via <a href="#">D18F2x7C_dct[1:0][SendMrsCmd]</a> when <a href="#">D18F2x7C_dct[1:0][EndDramInit]</a> = 0. This bit is expected to be set for the odd numbered rank of UDIMMs and LRDIMMs if SPD byte 63 indicates that address mapping is mirrored. See also <a href="#">2.10.5.7.1.1 [DDR3 MR Initialization]</a> , <a href="#">2.10.5.7.1.2 [Software Control Word Initialization]</a> , and <a href="#">F0RC14[AddressMirror]</a> . For LRDIMMs, BIOS should not enable this mode in the DCT until after <a href="#">2.10.5.7.1 [Software DDR3 Device Initialization]</a> is complete. The following bits are swapped when enabled: <ul style="list-style-type: none"> <li>• BA0 and BA1.</li> <li>• A3 and A4.</li> <li>• A5 and A6.</li> <li>• A7 and A8.</li> </ul> |
| 2     | <b>TestFail: memory test failed.</b> Set by BIOS to indicate that a rank is present but has failed memory training or a memory consistency test, indicating that the memory is bad. BIOS should treat CSEnable=1 and TestFail=1 as mutually exclusive.   |
| 1     | <b>Spare: spare rank.</b> This bit identifies the chip select associated with the spare rank. See <a href="#">2.10.9 [On-Line Spare]</a> .   |
| 0     | <b>CSEnable: chip select enable.</b>   |

**D18F2x78\_dct[1:0] DRAM Control**

See 2.10.1 [DCT Configuration Registers].

| Bits  | Description   |
|-------|---|
| 31:18 | Reserved.   |
| 17    | <b>AddrCmdTriEn: address command tristate enable.</b> Read-write. Reset: 0. BIOS: See 2.10.5.6.1=Tristate the address, command, and bank buses when a Deselect command is issued. |
| 16:15 | Reserved.   |
| 14:0  | Reserved.   |

**D18F2x7C\_dct[1:0] DRAM Initialization**

Reset: 0000\_0000h. See 2.10.1 [DCT Configuration Registers]. See 2.10.5.7.1 [Software DDR3 Device Initialization].

BIOS can directly control the DRAM initialization sequence using this register. To do so, BIOS sets EnDramInit to start DRAM initialization. BIOS should then complete the initialization sequence specified in the appropriate JEDEC specification. After completing the sequence, BIOS clears EnDramInit to complete DRAM initialization. BIOS should not assert LDTSTOP\_L while EnDramInit is set. Setting more than one of the command bits in this register (SendControlWord, SendMrsCmd, and SendAutoRefresh) at a time results in undefined behavior.

| Bits      | Description  |      |             |      |                            |           |                                       |      |                            |
|-----------|--|------|-------------|------|----------------------------|-----------|---------------------------------------|------|----------------------------|
| 31        | <b>EnDramInit: enable DRAM initialization.</b> Read-write. 1=Place the DRAM controller in the BIOS-controlled DRAM initialization mode. The DCT asserts memory reset and deasserts CKE when this bit is set. BIOS must wait until <a href="#">D18F2x98_dct[1:0][DctAccessDone]</a> = 1 before programming AssertCke=1 and DeassertMemRstX=1. BIOS must clear this bit after DRAM initialization is complete. BIOS must not set this bit on a DCT with no attached DIMMs. See 2.10.5.7.1 [Software DDR3 Device Initialization]. |      |             |      |                            |           |                                       |      |                            |
| 30        | <b>SendControlWord: send control word.</b> Read; write-1-only; cleared-by-hardware. 1= The DCT sends a control word to a chip select pair defined in <a href="#">D18F2xA8_dct[1:0][CtrlWordCS]</a> . This bit is cleared by hardware after the command completes. This bit is valid only when <a href="#">D18F2x90_dct[1:0][UnbuffDimm]</a> = 0.   |      |             |      |                            |           |                                       |      |                            |
| 29        | <b>SendZQCmd: send ZQ command.</b> Read; write-1-only; cleared-by-hardware. 1=The DCT sends the ZQCL calibration command with either all even or all odd chip selects active. The first command targets even chip selects. Subsequent commands alternate between even and odd chip selects. This bit is cleared by the hardware after the command completes. Reserved if <a href="#">D18F2x7C_dct[1:0][EnDramInit]</a> = 0 or <a href="#">D18F2x78_dct[1:0][AddrCmdTriEn]</a> =1 .   |      |             |      |                            |           |                                       |      |                            |
| 28        | <b>AssertCke: assert CKE.</b> Read-write. Setting this bit causes the DCT to assert the CKE pins. This bit cannot be used to deassert the CKE pins.  |      |             |      |                            |           |                                       |      |                            |
| 27        | <b>DeassertMemRstX: deassert memory reset.</b> Read-write. Setting this bit causes the DCT to deassert the memory reset. This bit cannot be used to assert the memory reset pin.   |      |             |      |                            |           |                                       |      |                            |
| 26        | <b>SendMrsCmd: send MRS command.</b> Read; write-1-only; cleared-by-hardware. 1=The DCT sends the MRS commands defined by the MrsAddress and MrsBank fields of this register. This bit is cleared by hardware after the command completes. See 2.10.5.7.1.1 [DDR3 MR Initialization]. Reserved if <a href="#">D18F2x78_dct[1:0][AddrCmdTriEn]</a> =1 .   |      |             |      |                            |           |                                       |      |                            |
| 25        | <b>SendAutoRefresh: send auto refresh command.</b> Read; write-1-only; cleared-by-hardware. 1=The DCT sends an auto refresh command. This bit is cleared by hardware after the command completes.  |      |             |      |                            |           |                                       |      |                            |
| 24        | Reserved.  |      |             |      |                            |           |                                       |      |                            |
| 23:21     | <b>MrsChipSel: MRS command chip select.</b> Read-write. Specifies which DRAM chip select is used for MRS commands. Defined only if (~EnDramInit   ~ <a href="#">D18F2x90_dct[1:0][UnbuffDimm]</a> ); otherwise MRS commands are sent to all chip selects. <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>000b</td><td>MRS command is sent to CS0</td></tr> <tr> <td>110b-001b</td><td>MRS command is sent to CS&lt;MrsChipSel&gt;</td></tr> <tr> <td>111b</td><td>MRS command is sent to CS7</td></tr> </table>  | Bits | Description | 000b | MRS command is sent to CS0 | 110b-001b | MRS command is sent to CS<MrsChipSel> | 111b | MRS command is sent to CS7 |

**D18F2x84\_dct[1:0] DRAM MRS**

Reset: 0000\_0004h. See [2.10.1 \[DCT Configuration Registers\]](#).

| Bits  | Description |
|-------|-------------|
| 31:24 | Reserved.   |

| 23                            | <b>PchgPDMoSel: precharge power down mode select.</b> Read-write. BIOS: 1. Specifies how a chip select enters and exits power down mode. This mode is enabled by <a href="#">D18F2x94_dct[1:0][PowerDownEn]</a> and its behavior varies based on the setting of <a href="#">D18F2x94_dct[1:0][PowerDownMode]</a> and <a href="#">MR0_dct[1:0][PPD]</a> . See <a href="#">2.10.5.7 [DRAM Device and Controller Initialization]</a> . <table><tr><th><a href="#">PowerDownMode</a></th><th><a href="#">PchgPDMoSel</a></th><th><a href="#">MR0[PPD]</a></th><th><a href="#">Description</a></th></tr><tr><td>0b</td><td>0b</td><td>0b</td><td>Full channel slow exit (DLL off)</td></tr><tr><td>0b</td><td>0b</td><td>1b</td><td>Full channel fast exit (DLL on)</td></tr><tr><td>0b</td><td>1b</td><td>xb</td><td>Full channel dynamic fast exit/slow exit</td></tr><tr><td>1b</td><td>0b</td><td>0b</td><td>Reserved</td></tr><tr><td>1b</td><td>0b</td><td>1b</td><td>Reserved</td></tr><tr><td>1b</td><td>1b</td><td>xb</td><td>Partial channel dynamic fast exit/slow exit</td></tr></table> See <a href="#">D18F2x248_dct[1:0][Txpdll, Txp]</a> . In dynamic fast exit/slow exit power down mode, the DCT dynamically issues MRS command(s) to the DRAM to specify the powerdown mode; the DCT specifies fast exit mode when chip selects on one of the two CKEs has recently been active; it specifies deep power down when chip selects on all CKEs have been idle. |                          |   |  | <a href="#">PowerDownMode</a> | <a href="#">PchgPDMoSel</a> | <a href="#">MR0[PPD]</a> | <a href="#">Description</a> | 0b      | 0b       | 0b | Full channel slow exit (DLL off) | 0b | 0b | 1b | Full channel fast exit (DLL on) | 0b | 1b | xb | Full channel dynamic fast exit/slow exit | 1b | 0b | 0b | Reserved | 1b | 0b | 1b | Reserved | 1b | 1b | xb | Partial channel dynamic fast exit/slow exit |

| [0]   | DIMM 0   |     |             |     |        |     |        |     |        |     |        |
| [1]   | DIMM 1   |     |             |     |        |     |        |     |        |     |        |
| [2]   | DIMM 2   |     |             |     |        |     |        |     |        |     |        |
| [3]   | DIMM 3   |     |             |     |        |     |        |     |        |     |        |
| 11:9  | Reserved.  |     |             |     |        |     |        |     |        |     |        |
| 8     | <b>ParEn: parity enable.</b> Read-write. Reset: 0. BIOS: See 2.10.5.7.1. 1=Enables address parity computation output, PAR, and enables the parity error input, ERR. This bit is valid only when UnbuffDimm==0. See <code>D18F2xA8_dct[1:0]</code> [ExtendedParityEn].  |     |             |     |        |     |        |     |        |     |        |
| 7:2   | Reserved.  |     |             |     |        |     |        |     |        |     |        |
| 1     | <b>ExitSelfRef: exit self refresh (after suspend to RAM or for DRAM training) command.</b> Read, write-1-only; cleared-by-hardware. Reset: 0. Writing a 1 to this bit causes the DRAM controller to bring the DRAMs out of self refresh mode. It also causes the DRAM controller to issue ZQCL and MRS MR0 commands. This command should be executed by BIOS when returning from the suspend to RAM state, after the DRAM controller configuration registers are properly initialized, or when self refresh is used during DRAM training. See 2.10.5.8 [DRAM Training]. This bit is read as a 1 while the exit-self-refresh command is executing; it is read as 0 at all other times. This bit should not be set if the DCT is disabled. After using this bit during a return from suspend to RAM, BIOS must issue an additional MRS command to set <code>MR0[PPD]=1</code> if Fast exit precharge powerdown mode is desired. See <code>D18F2x94_dct[1:0][1:0]</code> [PowerDownEn] and <code>D18F2x84_dct[1:0]</code> [PchgPDMModeSel]. |     |             |     |        |     |        |     |        |     |        |
| 0     | Reserved.  |     |             |     |        |     |        |     |        |     |        |

**D18F2x94\_dct[1:0] DRAM Configuration High**

See 2.10.1 [DCT Configuration Registers].

Table 160: Valid Values for D18F2x94\_dct[1:0][MemClkFreq]

| Bits    | Description          |
|---------|----------------------|
| 03h-00h | Reserved             |
| 04h     | 333 MHz. (667 MT/s)  |
| 05h     | Reserved             |
| 06h     | 400 MHz. (800 MT/s)  |
| 09h-07h | Reserved             |
| 0Ah     | 533 MHz. (1066 MT/s) |
| 0Dh-0Bh | Reserved             |
| 0Eh     | 667 MHz. (1333 MT/s) |
| 11h-0Fh | Reserved             |
| 12h     | 800 MHz. (1600 MT/s) |
| 15h-13h | Reserved             |
| 16h     | 933 MHz. (1866 MT/s) |
| 1Fh-17h | Reserved             |

| Bits  | Description   |      |             |    |  |    |   |       |  |    |   |
|-------|---|------|-------------|----|--|----|---|-------|--|----|---|
| 31:28 | Reserved.   |      |             |    |  |    |   |       |  |    |   |
| 27:24 | <p><b>DcqBypassMax: DRAM controller queue bypass maximum.</b> Read-write. Reset: 0h. BIOS: 2.10.5.6. The DRAM controller arbiter normally allows transactions to pass other transactions in order to optimize DRAM bandwidth. This field specifies the maximum number of times that the oldest memory-access request in the DRAM controller queue may be bypassed before the arbiter decision is overridden and the oldest memory-access request is serviced instead.</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>0h</td><td>No bypass; the oldest request is never bypassed.</td></tr> <tr> <td>1h</td><td>The oldest request may be bypassed no more than 1 time.</td></tr> <tr> <td>Eh-2h</td><td>The oldest request may be bypassed no more than &lt;DcqBypassMax&gt; time.</td></tr> <tr> <td>Fh</td><td>The oldest request may be bypassed no more than 15 times.</td></tr> </table> | Bits | Description | 0h | No bypass; the oldest request is never bypassed. | 1h | The oldest request may be bypassed no more than 1 time. | Eh-2h | The oldest request may be bypassed no more than <DcqBypassMax> time. | Fh | The oldest request may be bypassed no more than 15 times. |
| Bits  | Description   |      |             |    |  |    |   |       |  |    |   |
| 0h    | No bypass; the oldest request is never bypassed.  |      |             |    |  |    |   |       |  |    |   |
| 1h    | The oldest request may be bypassed no more than 1 time.   |      |             |    |  |    |   |       |  |    |   |
| Eh-2h | The oldest request may be bypassed no more than <DcqBypassMax> time.  |      |             |    |  |    |   |       |  |    |   |
| Fh    | The oldest request may be bypassed no more than 15 times.   |      |             |    |  |    |   |       |  |    |   |
| 23    | <p><b>ProcOdtDis: processor on-die termination disable.</b> Read-write. Reset: 0h. 1=The processor-side on-die termination is disabled. 0=Processor-side on-die termination enabled. See D18F2x9C_x0000_0000_dct[1:0][ProcOdt] for ODT definitions. Changes to this bit must be performed prior to DRAM initialization.</p>   |      |             |    |  |    |   |       |  |    |   |

|    |  |
|----|--|
| 22 | <p><b>BankSwizzleMode: bank swizzle mode.</b> Read-write. Reset: 0. BIOS: See 2.10.5.6. 1=Remaps the DRAM device bank address bits as a function of normalized physical address bits. Each of the bank address bits, as specified in Table 158 of D18F2x80_dct[1:0], are remapped as follows:</p> <ul style="list-style-type: none"> <li>Define X as a bank address bit (e.g., X=15 if the bank bit is specified to be address bit 15).</li> <li>Define S(n) as the state of address bit n (0 or 1) and B as the remapped bank address bit. Then,           <math display="block">B = S(X) \wedge S(X + 3) \wedge S(X + 6);</math>           for an 8-bank DRAM and D18F2x[6C:60]_dct[1:0][RankDef] = 0xb.<br/> <math display="block">B = S(X) \wedge S(X + 4) \wedge S(X + 7);</math>           for an 8-bank DRAM and D18F2x[6C:60]_dct[1:0][RankDef] = 10b.<br/> <math display="block">B = S(X) \wedge S(X + 5) \wedge S(X + 8);</math>           for an 8-bank DRAM and D18F2x[6C:60]_dct[1:0][RankDef] = 11b.         </li> </ul> <p>For example, encoding 02h of Table 158 would be remapped from Bank[2:0]={A15, A14, A13} to the following: Bank[2:0] = {A15^A18^A21, A14^A17^A20, A13^A16^A19}.</p> |
| 21 | <p><b>FreqChgInProg: frequency change in progress.</b> Read-only. Reset: 0. 1=A MEMCLK frequency change is in progress. The DDR phy asserts this bit when it is in the process of locking the PLL. BIOS should not program the phy registers while this bit is set. 0=DRAM-interface commands can be sent to the phy.</p>  |
| 20 | <p><b>SlowAccessMode: slow access mode (a.k.a. 2T mode).</b> Read-write. Reset: 0. BIOS: Table 69-Table 75. 1=One additional MEMCLK of setup time is provided on all DRAM address and control signals (not including CS, CKE, and ODT); i.e., these signals are driven for two MEMCLK cycles rather than one. 0=DRAM address and control signals are driven for one MEMCLK cycle. 2T mode may be needed in order to meet electrical requirements of certain DIMM speed and loading configurations.</p>   |
| 19 | <p><b>DcqArbBypassEn: DRAM controller arbiter bypass enable.</b> Read-write. Reset: 1. 0=DCQ entries are always passed through the arbiter. 1=Bypass the arbitration logic when there is only one entry in the DRAM controller queue entry.</p>  |
| 18 | <p><b>FourRankRDimm0: four rank registered DIMM 0.</b> Read-write. Reset: 0. BIOS: 0. 1=Four-rank registered DIMM or four-rank LRDIMM is connected to the channel CS 0, 1, 4, 5. See Table 155 [DIMM, Chip Select, and Register Mapping]. Changes the parameter selection for D18F2x214_dct[1:0][TwrwrSdDc, TwrwrDd] and D18F2x218_dct[1:0][TrdrdSdDc, TrdrdDd].</p>   |
| 17 | <p><b>FourRankRDimm1: four rank registered DIMM 1.</b> Read-write. Reset: 0. BIOS: 0. 1=Four-rank registered DIMM or four-rank LRDIMM is connected to the channel CS 2, 3, 6, 7. See Table 155 [DIMM, Chip Select, and Register Mapping]. Changes the parameter selection for D18F2x214_dct[1:0][TwrwrSdDc, TwrwrDd] and D18F2x218_dct[1:0][TrdrdSdDc, TrdrdDd].</p>   |
| 16 | <p><b>PowerDownMode: power down mode.</b> Read-write. Reset: 0. BIOS: 1. Specifies how a chip select or group of chip selects enters power down mode when enabled by D18F2x94_dct[1:0][PowerDownEn]. A chip select enters power down mode when the DCT deasserts the CKE pin. The command and address signals tristate one MEMCLK after CKE deasserts. The DCT behavior varies based on the setting of D18F2x84_dct[1:0][PchgPDMoSel]. See also Table 155 [DIMM, Chip Select, and Register Mapping].</p> <p>0=Channel CKE control mode; the DRAM channel is placed in power down mode when all chip selects associated with the channel are idle; both CKE pins for the channel operate in lock step in terms of placing the channel in power down mode.</p> <p>1=Chip select CKE control mode; the chip select group controlled by a CKE pin is placed in power down mode when no transactions are pending.</p>   |

| 15    | <b>PowerDownEn: power down mode enable.</b> Read-write. Reset: 0. BIOS: See 2.10.5.6. 1=Power down mode is enabled. Only precharge power down mode is supported, not active power down mode. See PowerDownMode, <a href="#">D18F2x84_dct[1:0][PchgPDMoSel]</a> , <a href="#">D18F2xA8_dct[1:0][PrtlChPDEnhEn, AggrPDEn]</a> , and <a href="#">D18F2x248_dct[1:0][PchgPDEnDelay]</a> .  |      |             |     |  |     |       |     |        |     |        |
|-------|--|------|-------------|-----|--|-----|-------|-----|--------|-----|--------|
| 14    | <b>DisDramInterface: disable the DRAM interface.</b> Read-write. Reset: 0. BIOS: See 2.10.5. 1=The DRAM controller is disabled and the DRAM interface is placed into a low power state. This bit must be set if there are no DIMMs connected to the DCT. If this bit is set, <a href="#">D18F2x90_dct[1:0][DimmEccEn]</a> and <a href="#">D18F2x90_dct[1:0][ParEn]</a> should not be set to avoid spurious MCA errors.   |      |             |     |  |     |       |     |        |     |        |
| 13    | Reserved.  |      |             |     |  |     |       |     |        |     |        |
| 12    | Reserved.  |      |             |     |  |     |       |     |        |     |        |
| 11:10 | <b>ZqcsInterval: ZQ calibration short interval.</b> Read-write. Reset: 00b. BIOS: See 2.10.5.6. This field specifies the programmable interval for the controller to send out the DRAM ZQ calibration short command.<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>ZQ calibration short command is disabled</td></tr> <tr> <td>01b</td><td>64 ms</td></tr> <tr> <td>10b</td><td>128 ms</td></tr> <tr> <td>11b</td><td>256 ms</td></tr> </table>                                    | Bits | Description | 00b | ZQ calibration short command is disabled | 01b | 64 ms | 10b | 128 ms | 11b | 256 ms |
| Bits  | Description  |      |             |     |  |     |       |     |        |     |        |
| 00b   | ZQ calibration short command is disabled   |      |             |     |  |     |       |     |        |     |        |
| 01b   | 64 ms  |      |             |     |  |     |       |     |        |     |        |
| 10b   | 128 ms   |      |             |     |  |     |       |     |        |     |        |
| 11b   | 256 ms   |      |             |     |  |     |       |     |        |     |        |
| 9:8   | Reserved.  |      |             |     |  |     |       |     |        |     |        |
| 7     | <b>MemClkFreqVal: memory clock frequency valid.</b> Read-write. Reset: 0. BIOS: See 2.10.5.3.2. BIOS should set this bit after setting up <a href="#">D18F2x94_dct[1:0][MemClkFreq]</a> to the proper value. This indicates to the DRAM controller that it may start driving MEMCLK at the proper frequency. BIOS should poll FreqChgInProg to determine when the DRAM-interface clocks are stable. This bit should not be set if the DCT is disabled. BIOS must change each DCT's operating frequency in order. |      |             |     |  |     |       |     |        |     |        |
| 6:5   | Reserved.  |      |             |     |  |     |       |     |        |     |        |
| 4:0   | <b>MemClkFreq: memory clock frequency.</b> Read-write. Reset: 000b. Specifies the frequency and rate of the DRAM interface (MEMCLK). See: <a href="#">Table 160 [Valid Values for D18F2x94_dct[1:0][MemClkFreq]]</a> . The rate is twice the frequency. See <a href="#">D18F5x84[DdrMaxRate]</a> and <a href="#">D18F5x84[DdrMaxRateEnf]</a> .   |      |             |     |  |     |       |     |        |     |        |

### **D18F2x98\_dct[1:0] DRAM Controller Additional Data Offset**

Reset: 8000\_0000h. See 2.10.1 [\[DCT Configuration Registers\]](#).

Each DCT includes an array of registers that are used primarily to control DRAM-interface electrical parameters. Access to these registers is accomplished as follows:

- Reads:
  - Write the register number to [D18F2x98\\_dct\[1:0\]\[DctOffset\]](#) with [D18F2x98\\_dct\[1:0\]\[DctAccessWrite\]=0](#).
  - Poll until [D18F2x98\\_dct\[1:0\]\[DctAccessDone\]=1](#).
  - Read the register contents from [D18F2x9C\\_dct\[1:0\]](#).
- Writes:
  - Write all 32 bits of register data to [D18F2x9C\\_dct\[1:0\]](#) (individual byte writes are not supported).
  - Write the register number to [D18F2x98\\_dct\[1:0\]\[DctOffset\]](#) with [D18F2x98\\_dct\[1:0\]\[DctAccess-](#)

Write]=1.

- Poll until [D18F2x98\\_dct\[1:0\]](#)[DctAccessDone]=1. This ensures that the contents of the write have been delivered to the phy.

Writes to any register in this additional address space causes the FIFO pointers to be reset.

| Bits | Description  |
|------|--|
| 31   | <b>DctAccessDone: DRAM controller access complete.</b> Read-only. 1=The access to the register is complete. 0=The access is still in progress. |
| 30   | <b>DctAccessWrite: DRAM controller read/write select.</b> RAZ; write. 0=Specifies a read access. 1=Specifies a write access.                   |
| 29:0 | <b>DctOffset: DRAM controller offset.</b> Read-write.  |

### **D18F2x9C\_dct[1:0] DRAM Controller Additional Data Port**

See [D18F2x98\\_dct\[1:0\]](#) for register access information. See [2.10.1 \[DCT Configuration Registers\]](#).

### **D18F2x9C\_x0000\_0000\_dct[1:0] DRAM Output Driver Compensation Control**

BIOS: [Table 69-Table 75](#).

| Bits      | Description  |      |             |      |                  |      |                  |      |                 |      |                 |           |          |

| 22:20       | <p><b>DqsDrvStren: DQS drive strength.</b> Read-write. Cold reset: 011b. Specifies the drive strength of the DQS pins.</p> <table> <tr> <th><u>Bits</u></th><th><u>Description</u></th></tr> <tr> <td>000b</td><td>0.75x</td></tr> <tr> <td>001b</td><td>1.0x</td></tr> <tr> <td>010b</td><td>1.25x</td></tr> <tr> <td>011b</td><td>1.5x</td></tr> <tr> <td>111b-100b</td><td>Reserved</td></tr> </table> <p>The DM[8:0] and DQS[17:9] functions share pins on the DIMM connector. The function selection is applied based on whether the DIMM is populated with by-4 (x4) DRAM devices, in which case the DQS[17:9] function is applied, or not (x8 or x16 DRAM devices), in which case the DM[8:0] function is applied. However, the DM function is associated with the data pin group and should therefore be controlled DataDrvStren. While the processor supports concurrent population of x4 and non-x4 DIMMs, the determination as to which field controls the drive strength of these pins is applied statically based on these rules:</p> <ul style="list-style-type: none"> <li>• If all DIMMs of a channel are populated with non-x4 devices, DataDrvStren is applied.</li> <li>• If any DIMMs of a channel are populated with x4 devices, DqsDrvStren is applied.</li> </ul> | <u>Bits</u> | <u>Description</u> | 000b | 0.75x | 001b | 1.0x  | 010b | 1.25x | 011b | 1.5x | 111b-100b | Reserved |

These registers control the timing of write DQ with respect to MEMCLK and allow transmit DQS to be cen-

tered in the data eye. The delay starts 1 UI before the rising edge of MEMCLK corresponding to the CAS-write-latency. See 2.10.5.8 [DRAM Training]. WrDatGrossDly must be programmed for a given DIMM and lane such that  $WrDatDly - WrDqsDly \leq 0.5 \text{ MEMCLKs}$ .

### D18F2x9C\_x0000\_0004\_dct[1:0] DRAM Address/Command Timing Control

BIOS: [Table 69-Table 75](#).

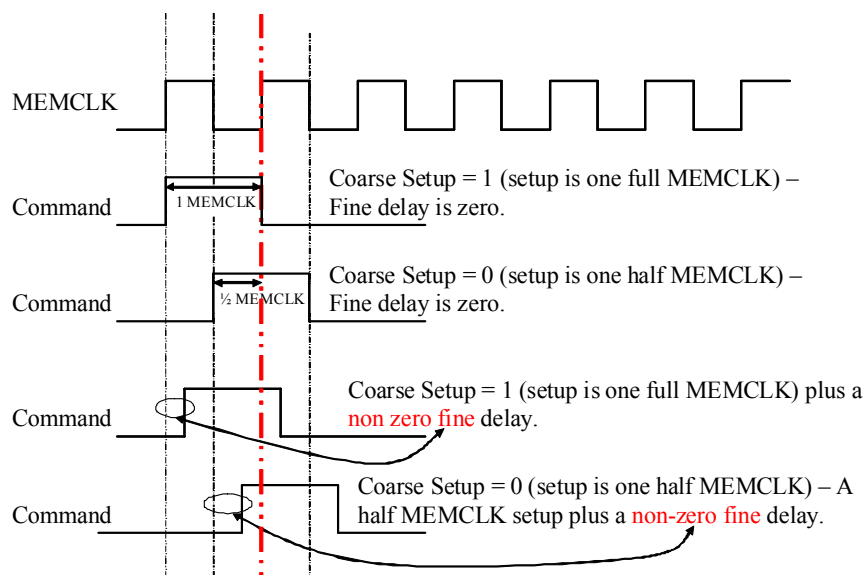

Figure 18: Address/Command Timing at the Processor Pins

This register controls the timing of the address, command, chip select, ODT and clock enable pins with respect to MEMCLK as shown in Figure 18. See 2.10.5.3.2 [DRAM Channel Frequency Change] and 2.10.5.3.3 [Phy Fence Programming]. 2T timing is controlled by D18F2x94\_dct[1:0][SlowAccessMode]. If a setup time (course delay) field is changed and D18F2x94\_dct[1:0][MemClkFreqVal]=1, then software must toggle MemClkFreqVal for the delay to take effect.

| Bits    | Description  |      |             |     |                   |         |                                |     |                    |

#### D18F2x9C\_x0000\_000D\_dct[1:0] DRAM Phy DLL Control

Cold Reset: 0000\_0000h. This register defines programmable options for the phy's DLLs for power savings. There are two identical sets of configuration registers: one for the transmit DLLs (those running off of the phy's internal PCLK which is running at rate of 2\*MEMCLK) and receive DLLs (those running off of the DQS from the DIMMs). These values are programmed by BIOS based on programmed DDR frequency. This register must be programmed before DRAM device initialization.

| Bits  | Description |
|-------|-------------|
| 31:26 | Reserved.   |

|       |  |
|-------|--|
| 25:24 | <b>RxDLLWakeupTime: receive DLL wakeup time.</b> Read-write. BIOS: See <a href="#">2.10.5.10</a> . Specifies the number of PCLKs that the DLL standby signal must deassert prior to a DLL relock event or before read traffic is sent to the receive DLLs.   |
| 23    | Reserved.  |
| 22:20 | <b>RxCPUpdPeriod: receive charge pump period.</b> Read-write. BIOS: See <a href="#">2.10.5.10</a> . Specifies the number of DLL relocks required to keep the receive DLLs locked for the period where there is no read traffic.  |
| 19:16 | <b>RxMaxDurDllNoLock: receive maximum duration DLL no lock.</b> Read-write. BIOS: See <a href="#">2.10.5.6</a> . Specifies the number of PCLK cycles that occur before the phy DLLs relock. A DLL relock occurs every $2^{\text{RxMaxDurDllNoLock}}$ if there are no reads during the period. 0=DLL power saving disabled.   |
| 15:10 | Reserved.  |
| 9:8   | <b>TxDLLWakeupTime: transmit DLL wakeup time.</b> Read-write. BIOS: See <a href="#">2.10.5.10</a> . Specifies the number of PCLK's that the DLL standby signal must deassert prior to a DLL relock event or before write traffic is sent to transmit DLLs.   |
| 7     | Reserved.  |
| 6:4   | <b>TxCPUpdPeriod: transmit charge pump DLL wakeup time.</b> Read-write. BIOS: See <a href="#">2.10.5.10</a> . Specifies the number of DLL relocks required to keep the TxDLLs locked for the period where there is no write traffic.   |
| 3:0   | <b>TxMaxDurDllNoLock: transmit maximum duration DLL no lock.</b> Read-write. BIOS: See <a href="#">2.10.5.6</a> . Specifies the number of PCLK cycles that occur before the phy DLLs relock. A DLL relock occurs every $2^{\text{TxMaxDurDllNoLock}}$ if there are no writes during the period. 0=DLL power saving disabled. |

### D18F2x9C\_x0000\_00[2A:10]\_dct[1:0] DRAM DQS Receiver Enable Timing

BIOS: See [2.10.5.8.2](#).

Table 165: [Register Mapping](#) for D18F2x9C\_x0000\_00[2A:10]\_dct[1:0]

Each of these registers control the timing of the receiver enable from the start of the read preamble with respect to MEMCLK. See 2.10.5.8 [DRAM Training]. These delay registers must be programmed such that across all DIMMs and lanes  $\text{MAX}(\text{DqsRcvEnDelay}) - \text{MIN}(\text{DqsRcvEnDelay}) \leq 7 \text{ UI}$ .

### D18F2x9C\_x0000\_00[4A:30]\_dct[1:0] DRAM DQS Write Timing

BIOS: See 2.10.5.8.1. Each of these registers control the DQS timing delay for write commands relative to MEMCLK. The delay starts at the rise edge of MEMCLK corresponding to the CAS-writelatency. Each control includes a gross timing field and a fine timing field, the sum of which is the total delay.

Table 167: Register Mapping for D18F2x9C\_x0000\_00[4A:30]\_dct[1:0]

| Register                     | Function         |
|------------------------------|------------------|
| D18F2x9C_x0000_0030_dct[1:0] | DIMM 0 Bytes 1-0 |

### **D18F2x9C\_x0000\_00[52:50]\_dct[1:0] DRAM Phase Recovery Control**

BIOS: See 2.10.5.8. These registers are used by BIOS for hardware assisted DRAM training. Writes to these registers seed the phase recovery engine prior to training. Reads from the registers indicate how much the phase recovery engine has advanced to align the MEMCLK and DQS edges and is under hardware control.

Table 169: [Register Mapping](#) for D18F2x9C\_x0000\_00[52:50]\_dct[1:0]

#### **D18F2x9C\_x0D0F\_812F\_dct[1:0] Tristate Configuration**

Reset: 0000\_00A0h. BIOS: See [2.10.5.10](#).

| Bits | Description   |
|------|---|
| 31:8 | Reserved.   |
| 7    | <b>Add16Tri: MEMADD[16] tri-state.</b> Read-write. Specifies tri-state control for the memory address[16] signal. 1=Signal is tri-stated. 0=Signal is not tri-stated. |
| 6    | Reserved.   |
| 5    | <b>Add17Tri: MEMADD[17] tri-state.</b> Read-write. Specifies tri-state control for the memory address[17] signal. 1=Signal is tri-stated. 0=Signal is not tri-stated. |
| 4:1  | Reserved.   |
| 0    | <b>PARTri: MEMPARG tri-state.</b> Read-write. Specifies tri-state control for the memory parity signal. 1=Signal is tri-stated. 0=Signal is not tri-stated.           |

#### **D18F2x9C\_x0D0F\_E003\_dct[1:0] Phy Calibration Configuration**

Cold reset: 0000\_0210h.

| Bits  | Description  |
|-------|--|
| 31:15 | Reserved.  |
| 14    | <b>DisAutoComp: disable automatic compensation.</b> Read-write. BIOS: See <a href="#">2.10.5</a> and <a href="#">2.10.5.3.4</a> . 1=Disable the compensation control state machine. 0=The phy automatic compensation engine is enabled. Setting this bit in DCT0 or DCT1 disables the compensation engine for DCT0 and DCT1. |
| 13    | <b>DisablePredriverCal: disable predriver calibration.</b> Read-write. BIOS: See <a href="#">2.10.5.3.4</a> . 1=Disables hardware update of predriver calibration codes. Setting this bit in DCT0 affects both DCT0 and DCT1; Setting this bit in DCT1 has no effect.  |
| 12:0  | Reserved.  |

**D18F2x9C\_x0D0F\_E006\_dct[1:0] Phy PLL Lock Time**

Cold reset: 0000\_0190h.

| Bits  | Description   |
|-------|---|
| 31:16 | Reserved.   |
| 15:0  | <b>PllLockTime: pll lock time.</b> Read-write. BIOS: <a href="#">2.10.5.3.2</a> . Specifies the number of 5ns periods the phy waits for PLLs to lock during a frequency change. |

**D18F2x9C\_x0D0F\_E008\_dct[1:0] Phy Fence Register**

Cold reset: 0000\_0013h.

| Bits | Description  |
|------|--|
| 31:5 | Reserved.  |
| 4:0  | <b>FenceValue: fence value.</b> Read-only. Specifies the fence value used to create the fence bit in the DLL delay registers. See <a href="#">2.10.5.3.3 [Phy Fence Programming]</a> . |

**D18F2x9C\_x0D0F\_E00A\_dct[1:0] Phy Dynamic Power Mode**

Cold reset: 0000\_0000h.

| Bits | Description  |
|------|--|
| 31:5 | Reserved.  |
| 4    | <b>SkewMemClk: skew MEMCLK.</b> Read-write. BIOS: IF ((REG==D18F2x9C_x0D0F_E00A_dct[0]) & ~D18F2x94_dct[0][DisDramInterface] & ~D18F2x94_dct[1][DisDramInterface]) THEN 1 ELSE 0 ENDIF. 1=Skew MEMCLK signals with respect to other channel. SkewMemClk must be 0 if <a href="#">D18F2x94_dct[1:0][DisDramInterface]=1</a> for either channel. This bit must be set prior to setting <a href="#">D18F2x94_dct[1:0][MemClkFreqVal]</a> during DRAM initialization. See <a href="#">2.10.5.3.2 [DRAM Channel Frequency Change]</a> . |
| 3:0  | Reserved.  |

**D18F2x9C\_x0D0F\_E013\_dct[1:0] Phy PLL Regulator Wait Time**

Cold reset: 0000\_00D8h.

| Bits  | Description  |
|-------|--|
| 31:16 | Reserved.  |
| 15:0  | <b>PllRegWaitTime: PLL regulator wait time.</b> Read-write. BIOS: <a href="#">2.10.5.3</a> . 1=Specifies the number of 5 ns periods the phy waits for the PLL to become stable when coming out of PLL regulator off power down mode. |

**D18F2xA0\_dct[1:0] DRAM Controller Miscellaneous**Reset: 0000\_0000h. Read-only; Updated-by-hardware. See [2.10.1 \[DCT Configuration Registers\]](#).

| Bits | Description  |
|------|--|
| 31   | <b>RcvParErr: parity error status.</b> 1=The M[D:A]_ERR_L pin is asserted. 0=The M[D:A]_ERR_L pin is not asserted. Reserved if <a href="#">D18F2xA8_dct[1:0][LrDimmErrOutMonEn]!</a> =1. |
| 30:0 | Reserved.  |

| Bits  | Description  |
|-------|--|
| 31:30 | Reserved.  |
| 29    | <b>RefChCmdMgtDis: refresh channel command management disable.</b> Read-write. Reset: 0. 1=DCTs issue refresh commands independently. 0=DCTs stagger the issue of refresh commands. This bit must be set the same in all DCTs.   |
| 28    | <b>FastSelfRefEntryDis: fast self refresh entry disable.</b> Read-write. Reset: 1. <b>Same-for-all.</b> BIOS: ~D18F2x1B4[FlushWrOnS3StpGnt]. 1=DCT pushes outstanding transactions to memory prior to entering self refresh. 0=DCT enters self refresh immediately unless instructed to push outstanding transactions to memory by D18F2x11C[FlushWrOnStpGnt] or D18F2x1B4[FlushWrOnS3StpGnt]. |
| 27    | <b>CsMux67: chip select mux 6 and 7.</b> See: CsMux45. BIOS: Table 196. See also CSTimingMux67.  |
| 26    | <b>CsMux45: chip select mux 4 and 5.</b> Read-Write. Reset: 0. BIOS: Table 195. Specifies the DCT mode used to drive the associated chip selects. 0=Chip select mode. 1=Extended address mode; A[17:16] are driven on the DRAM CS pins.  |

| 25:24   | <p><b>WrDqDqsEarly: DQ and DQS write early.</b> Read-Write. Reset: 0. Specifies the DQ and DQS launch timing for write commands relative to the Tcwl MEMCLK, changing the effective reference point to be earlier than noted in <a href="#">D18F2x9C_x0000_0[3:0]0[3:1]_dct[1:0]</a> and <a href="#">D18F2x9C_x0000_00[4A:30]_dct[1:0]</a>.</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>0 MEMCLK early</td></tr> <tr> <td>01b</td><td>0.5 MEMCLK early</td></tr> <tr> <td>10b</td><td>1.0 MEMCLK early</td></tr> <tr> <td>11b</td><td>Reserved</td></tr> </table>   | Bits | Description | 00b     | 0 MEMCLK early | 01b | 0.5 MEMCLK early    | 10b     | 1.0 MEMCLK early | 11b | Reserved            |         |          |     |                     |         |          |     |                     |         |          |

**D18F2x10C Swap Interleaved Region Base/Limit**

IF ([D18F2x118\[LockDramCfg\]](#)) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0000\_0000h. Enables swapping a region below 16G with the same sized region located at the bottom of memory. This register is typically used to map addresses of a graphics frame buffer located below the sub-4GB IO hole to interleaved DRAM in low memory, and is only necessary if the frame buffer normally maps to non-interleaved memory.

- The size of the swapped high region must be a integer multiple of 128M, defined to be {IntLvRgnBaseAddr, 000b, 000000h} to {IntLvRgnLmtAddr, 111b, FFFFFFFh}.
- The size of the swapped region must be less than or equal to the alignment of IntLvRgnBaseAddr.
  - E.g. If IntLvRgnBaseAddr=2h then size <=256MB and BIOS programs IntLvRgnLmtAddr <= IntLvRgnBaseAddr + 1h.
  - It is expected that BIOS may program IntLvRgnBaseAddr to a value less than the base address of the graphics frame buffer if realignment is necessary to achieve a larger swap size.
- The location of the low region is defined to be 0000\_0000h to {IntLvRgnLmtAddr - IntLvRgnBaseAddr, 111b, FFFFFFFh}.
- The swapped region must be all DRAM. I.e. No IO hole.
- Channel interleaving must be enabled and the DCTs must be of unequal size.
- Swapping must not be enabled on more than one node, and [D18F1x\[17C:140,7C:40\]\[DramBase\]](#) must be zero.
- IntLvRgnSwapEn can only be asserted if the probe filter is disabled. (~PrbFltrEn)

- See [D18F2x110](#)[DctSelIntLvEn]. See [2.10.7](#) [Memory Hoisting].

|   |   |
|---|---|
| 5 | <b>DctDatIntLv: DRAM controller data interleave enable.</b> IF (D18F2x118[LockDramCfg]) THEN Read-only. ELSE Read-write. ENDIF. BIOS: Set if ECC is enabled. 1=DRAM data bits from every two consecutive 64-bit DRAM lines are interleaved when written to DRAM (even bits of the ECC calculation on even beats, odd bits of the ECC calculation on odd beats) such that a dead bit of a DRAM device is correctable. See 2.13.2 [DRAM Considerations for ECC].  |
| 4 | Reserved.   |
| 3 | <b>MemClrInit: memory clear initialization.</b> IF (D18F2x118[LockDramCfg]) THEN Read-only. ELSE Read-write. ENDIF. 1=The node writes 0's to all locations of system memory attached to the node and sets the MemCleared bit. The status of the memory clear operation can be determined by reading the MemClrBusy and MemCleared bits. This command is ignored if MemClrBusy=1 when the command is received. DramEnable must be set before setting MemClrInit. The memory prefetcher must be disabled by setting D18F2x11C[PrefIoDis] and D18F2x11C[PrefCpuDis] before memory clear initialization and then can be re-enabled when MemCleared=1.   |
| 2 | <b>DctSelIntLvEn: DRAM controller interleave enable.</b> IF (D18F2x118[LockDramCfg]   (D18F5x84[DctEn]!=1b)) THEN Read-only. ELSE Read-write. ENDIF. BIOS: See 2.10.5.6. 1=Channel interleave is enabled; DctSelIntLvAddr specifies which address bit is used to select between DCT0 and DCT1; this applies from the base system memory address of the node (specified by D18F1x[17C:140,7C:40] [DRAM Base/Limit]) to DctSelBaseAddr (if enabled). If the amount of memory connected to each of the DCTs is different, then channel interleaving may be supported across the address range that includes both DCTs, the top of which is specified by DctSelBaseAddr; the remainder of the address space, above DctSelBaseAddr, would then be allocated to only the DCT connected to the larger amount of memory, specified by DctSelHi. |
| 1 | <b>DctSelHi: DRAM controller high select.</b> IF (D18F2x118[LockDramCfg]) THEN Read-only. ELSE Read-write. ENDIF. If DctSelHiRngEn is set, this specifies which DCT receives accesses with addresses in the high range (greater than or equal to DctSelBaseAddr). 0=High addresses go to DCT0. 1=High addresses go to DCT1.   |
| 0 | <b>DctSelHiRngEn: DRAM controller select high range enable.</b> IF (D18F2x118[LockDramCfg]   (D18F5x84[DctEn]!=1b)) THEN Read-only. ELSE Read-write. ENDIF. 1=Enables addresses greater than or equal to DctSelBaseAddr[47:27] to be used to select between DCT0 and DCT1; DctSelHi specifies which DCT occupies the high range.  |

### D18F2x114 DRAM Controller Select High

IF (D18F2x118[LockDramCfg]) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0000\_0000h.

### D18F2x118 Memory Controller Configuration Low

Fields in this register (bits[17:0]) indicate priority of request types. Variable priority requests enter the memory controller as medium priority and are promoted to high priority if they have not been serviced in the time specified by MctVarPriCntLmt. This feature may be useful for isochronous IO traffic. If isochronous traffic is specified to be high priority, it may have an adverse effect on the bandwidth and performance of the devices associated with the other types of traffic. However, if isochronous traffic is specified as medium priority, the processor may not meet the isochronous bandwidth and latency requirements. The variable priority allows the memory controller to optimize DRAM transactions until isochronous traffic reaches a time threshold and must be serviced more quickly.

### D18F2x11C Memory Controller Configuration High

The two main functions of this register are to control write bursting and memory prefetching.

**Write bursting.** DctWrLimit and MctWrLimit specify how writes may be burst from the MCT into the DCT to improve DRAM efficiency. When the number of writes in the MCT reaches the value specified in MctWrLimit, then they are all burst to the DCTs at once. Prior to reaching the watermark, a limited number of writes can be passed to the DCTs (specified by DctWrLimit), tagged as low priority, for the DCTs to complete when otherwise idle. Rules regarding write bursting:

- Write bursting mode only applies to low-priority writes. Medium and high priority writes are not withheld from the DCTs for write bursting.
- If write bursting is enabled, writes stay in the MCQ until the threshold specified by MctWrLimit is reached.
- Once the threshold is reached, all writes in MCQ are converted to medium priority.
- Any write in MCQ that matches the address of a subsequent access is promoted to either medium priority or the priority of the subsequent access, whichever is higher.
- DctWrLimit only applies to low-priority writes.

**Memory prefetching.** The MCT prefetcher detects stride patterns in the stream of requests and then, for predictable stride patterns, generates prefetch requests. A stride pattern is a pattern of requests through system memory that are the same number of cachelines apart. The prefetcher supports strides of -4 to +4 cachelines,

which can include alternating patterns (e.g. +1, +2, +1, +2), and can prefetch 1, 2, 3, 4, or 5 cachelines ahead, depending on the confidence. In addition, a fixed stride mode (non-alternating) may be used for IO requests which often have fixed stride patterns. This mode bypasses the stride predictor such that CPU-access stride predictions are not adversely affected by IO streams.

The MCT tracks several stride patterns simultaneously. Each of these has a confidence level associated with it that varies as follows:

- Each time a request is received that matches the stride pattern, the confidence level increases by one.
- Each time a request is received within +/- 4 cachelines of the last requested cacheline in the pattern that does not match the pattern, then the confidence level decreases by one.
- When the confidence level reaches the saturation point specified by PrefConfSat, then it no-longer increments.

Each request that is not within +/- 4 cachelines of the last requested cacheline line of all the stride patterns tracked initiates a new stride pattern by displacing one of the existing least-recently-used stride patterns.

The memory prefetcher uses an adaptive prefetch scheme to adjust the prefetch distance based upon the buffer space available for prefetch request data. The adaptive scheme counts the total number of prefetch requests and the number of prefetch requests that cannot return data because of buffer availability. After every 16 prefetch requests, the prefetcher uses the following rules to adjust the prefetch distance:

- If the ratio of prefetch requests that cannot return data to total prefetch requests is greater than or equal to [D18F2x1B0](#)[AdapPrefMissRatio] then the prefetch distance is reduced by [D18F2x1B0](#)[AdapPrefNegativeStep].
- If the ratio of prefetch requests that cannot return data to total prefetch requests is less than [D18F2x1B0](#)[AdapPrefMissRatio] then the prefetch distance is increased by [D18F2x1B0](#)[AdapPrefPositiveStep].
- If the adjusted prefetch distance is greater than the prefetch distance defined for the current confidence level, the prefetch distance for the current confidence level is used.

The adaptive prefetch scheme supports fractional prefetch distances by alternating between two whole number prefetch distances. For example a prefetch distance of 1.25 causes a prefetch distance sequence of: 1, 1, 1, 2, 1, 1, 1, 2.

| Bits | Description   |
|------|---|
| 31   | <b>MctScrubEn: MCT scrub enable.</b> Read-write. Reset: 0. 1=Enables periodic flushing of prefetches and writes based on the DRAM scrub rate. This is used to ensure that prefetch and write data aging is not so long that soft errors accumulate and become uncorrectable. When enabled, each DRAM scrub event causes a single prefetch to be de-allocated (the oldest one) and all queued writes to be flushed to DRAM.                |
| 30   | <b>FlushWr: flush writes command.</b> Read; write-1-only; cleared-by-hardware. Reset: 0. Setting this bit causes write bursting to be canceled and all outstanding writes to be flushed to DRAM. This bit is cleared when all writes are flushed to DRAM.   |
| 29   | <b>FlushWrOnStpGnt: flush writes on stop-grant.</b> Read-write. Reset: 0. BIOS: <a href="#">~D18F2x1B4</a> [FlushWrOnS3StpGnt]. 1=Causes write bursting to be canceled and all outstanding writes to be flushed to DRAM when in the stop-grant state.   |
| 28   | <b>PrefDramTrainMode: prefetch DRAM training mode.</b> Read-write; cleared-by-hardware. Reset: 0. 1=Enable DRAM training mode. Hardware clears this bit when the prefetch request limit is reached. Writing a zero to this bit clears the prefetch buffer and disables the DRAM training mode prefetcher. BIOS must write a zero to this bit after training is complete. See <a href="#">2.10.5.8.6 [Continuous Pattern Generation]</a> . |

| 27:25       | <b>PrefThreeConf: prefetch three-ahead confidence.</b> Read-write. Reset: 100b. BIOS: 110b. Confidence level required in order to prefetch three cachelines ahead (same encoding as PrefTwoConf below).  |             |                    |      |    |           |                 |      |    |     |                         |

#### D18F2x1B4 Extended Memory Controller Configuration High Register

| Bits | Description |
|------|-------------|
| 31   | Reserved.   |

|       |  |
|-------|--|
| 30:28 | <b>S3SmafId: S3 SMAF id.</b> Read-write. Reset: 100b. SMAF encoding of <a href="#">D18F3x[84:80]</a> corresponding to the ACPI S3 state when FlushWrOnS3StpGnt=1. Reserved when FlushWrOnS3StpGnt=0.   |
| 27    | <b>FlushWrOnS3StpGnt: flush write on S3 stop grant.</b> Read-write. Reset: 0. BIOS: 1. 1=Write bursting is canceled and all outstanding writes are flushed to DRAM when in the stop-grant state and the SMAF code is equal to S3SmafId, indicating entry into the ACPI S3 state. See <a href="#">D18F2xA8_dct[1:0][FastSelfRefEntryDis]</a> , <a href="#">D18F2x11C[FlushWrOnStpGnt]</a> . |
| 26    | Reserved.  |
| 25:23 | Reserved.  |
| 22    | <b>SpecPrefDisWm1: speculative prefetch disable watermark 1.</b> Read-write. Reset: 0. 0=Disable speculative prefetches at the DcqBwThrotWm2 limit. 1=Disable speculative prefetches at the DcqBwThrotWm1 limit. See also <a href="#">D18F2x1B0[SpecPrefDis]</a> .   |
| 21    | <b>RegionAlloWm2: region prefetch allocate watermark 2.</b> Read-write. Reset: 0. See DemandAlloWm2.   |
| 20    | <b>RegionPropWm2: region prefetch propagate watermark 2.</b> Read-write. Reset: 0. See DemandPropWm2.  |
| 19    | <b>StrideAlloWm2: stride prefetch allocate watermark 2.</b> Read-write. Reset: 1. See DemandAlloWm2.   |
| 18    | <b>StridePropWm2: stride prefetch propagate watermark 2.</b> Read-write. Reset: 1. See DemandPropWm2.  |
| 17    | <b>DemandAlloWm2: demand request allocate watermark 2.</b> Read-write. Reset: 1. Specifies the behavior from the DcqBwThrotWm1 limit to the DcqBwThrotWm2 limit. 0=Requests do not allocate a new entry. 1=Requests allocate a new entry; defined only if (DemandAlloWm1 & DemandPropWm2).   |
| 16    | <b>DemandPropWm2: demand request propagate watermark 2.</b> Read-write. Reset: 1. Specifies the behavior from the DcqBwThrotWm1 limit to the DcqBwThrotWm2 limit. 0=Requests do not update existing entries. 1=Requests update existing entries; defined only if (DemandPropWm1=1).  |
| 15    | <b>RegionAlloWm1: region prefetch allocate watermark 1.</b> Read-write. Reset: 0. See DemandAlloWm1.   |
| 14    | <b>RegionPropWm1: region prefetch propagate watermark 1.</b> Read-write. Reset: 1. See DemandPropWm1.  |
| 13    | <b>StrideAlloWm1: stride prefetch allocate watermark 1.</b> Read-write. Reset: 1. See DemandAlloWm1.   |
| 12    | <b>StridePropWm1: stride prefetch propagate watermark 1.</b> Read-write. Reset: 1. See DemandPropWm1.  |
| 11    | <b>DemandAlloWm1: demand request allocate watermark 1.</b> Read-write. Reset: 1. Specifies the behavior prior to the DcqBwThrotWm1 limit. 0=Requests do not allocate a new entry. 1=Requests allocate a new entry; defined only if (DemandPropWm1=1).  |
| 10    | <b>DemandPropWm1: demand request propagate watermark 1.</b> Read-write. Reset: 1. Specifies the behavior prior to the DcqBwThrotWm1 limit. 0=Requests do not update existing entries. 1=Requests update existing entries.  |

|     |   |
|-----|---|
| 9:5 | <b>DcqBwThrotWm2: DCQ bandwidth throttle watermark 2.</b> Read-write. Reset: 06h. BIOS: <a href="#">Table 197</a> . Specifies a prefetch throttling watermark based on the number of outstanding DRAM read requests. This field is reserved when <a href="#">D18F2x1B0[DcqBwThrotWm]</a> != 0. When throttling is enabled, if the number of outstanding DRAM read requests exceeds DcqBwThrotWm2 both request allocate and propagate are blocked and new prefetches are disabled. When throttling is enabled, DcqBwThrotWm2 should be programmed to a value greater than DcqBwThrotWm1. 0h=Throttling is disabled. Legal values are 0h through 18h. |
| 4:0 | <b>DcqBwThrotWm1: DCQ bandwidth throttle watermark 1.</b> Read-write. Reset: 03h. BIOS: <a href="#">Table 197</a> . Specifies a prefetch throttling watermark based on the number of outstanding DRAM read requests. This field is reserved when <a href="#">D18F2x1B0[DcqBwThrotWm]</a> != 0. 0h=Throttling is disabled. Legal values are 0h through 18h.  |

| [63]   | Data[63]   |     |             |     |         |        |  |      |          |

### **D18F2x278\_dct[1:0] DRAM DQ Mask High**

| Bits | Description  |
|------|--|
| 31:0 | <b>DQMask[63:32]: DQ mask.</b> See: <a href="#">D18F2x274_dct[1:0][DQMask[31:0]]</a> . |

**D18F2x27C\_dct[1:0] DRAM ECC Mask**

Reset: 0000\_0000h. See 2.10.1 [DCT Configuration Registers]. See 2.10.5.8.6.1 [DRAM Training Pattern Generation].

| Bits       | Description   |
|------------|---|
| 31:8       | Reserved.   |
| 7:0        | <b>EccMask: ECC mask.</b> Read-write. 1=The corresponding ECC DQ bit will not be compared. 0=The corresponding ECC DQ bit will be compared. See D18F2x264_dct[1:0][ErrCnt]. |
| <u>Bit</u> | <u>Description</u>  |
| [0]        | ECC[0]  |
| [6:1]      | ECC[<EccMask>]  |
| [7]        | ECC[7].   |

**D18F2x28C\_dct[1:0] DRAM Command 2**

Reset: 0000\_0000h. See 2.10.1 [DCT Configuration Registers]. See 2.10.5.8.6.1 [DRAM Training Pattern Generation]. This register may only be used when D18F2x250\_dct[1:0][CmdTestEnable]=1.

| Bits       | Description  |
|------------|--|
| 31         | <b>SendActCmd: send activate command.</b> Read; write-1-only; cleared-by-hardware. 1=The DCT sends an activate command as specified by ChipSelect, Bank, and Address. This bit is cleared by hardware after the command completes.   |
| 30         | <b>SendPchgCmd: send precharge all command.</b> Read; write-1-only; cleared-by-hardware. The DCT sends a precharge command based on CmdAddress[10]. This bit is cleared by hardware after the command completes. 0=Command has completed. 1=If (CmdAddress[10]=1) then send a precharge all command as specified by CmdChipSelect; If (CmdAddress[10]=0) then send a precharge command as specified by CmdChipSelect, CmdBank. |
| 29:22      | <b>CmdChipSelect: command chip select.</b> Read-write. Specifies the chip select. For LRDIMMs, BIOS programs this field with the logical rank CS.  |
| <u>Bit</u> | <u>Description</u>   |
| [0]        | CS0  |
| [6:1]      | CS<CmdChipSelect>  |
| [7]        | CS7  |
| 21:19      | <b>CmdBank[2:0]: command bank [2:0].</b> Read-write. Specifies the bank address.   |
| 18         | Reserved.  |
| 17:0       | <b>CmdAddress[17:0]: command address [17:0].</b> Read-write. Specifies the row address.  |

**D18F2x290\_dct[1:0] DRAM Status 3**

Reset: 0000\_0000h. See 2.10.1 [DCT Configuration Registers]. See 2.10.5.8.6.1 [DRAM Training Pattern Generation].

| Bits  | Description |
|-------|-------------|
| 31:27 | Reserved.   |

| 26:24       | <b>ErrBeatNum: error beat number.</b> Read-only. Indicates the data beat of the first error occurrence in the command reported by ErrCmdNum when <a href="#">D18F2x264_dct[1:0][ErrCnt]</a> > 0 and <a href="#">D18F2x260_dct[1:0][CmdCnt]</a> > 0. | 7:0   | <b>EccErr: ECC error.</b> Read-only. Indicates error detection status on a per bit basis when <a href="#">D18F2x264_dct[1:0][ErrCnt]</a> > 0. Status is accumulated until cleared by <a href="#">D18F2x250_dct[1:0][ResetAllErr]</a> .<br><table> <tr> <th>Bit</th><th>Description</th></tr> <tr> <td>[0]</td><td>ECC[0]</td></tr> <tr> <td>[6:1]</td><td>ECC[&lt;EccErr&gt;]</td></tr> <tr> <td>[7]</td><td>ECC[7].</td></tr> </table> | Bit | Description | [0] | ECC[0] | [6:1] | ECC[<EccErr>] | [7] | ECC[7]. |
| Bit   | Description   |     |             |     |        |       |               |     |         |
| [0]   | ECC[0]  |     |             |     |        |       |               |     |         |
| [6:1] | ECC[<EccErr>]   |     |             |     |        |       |               |     |         |
| [7]   | ECC[7].   |     |             |     |        |       |               |     |         |

### 3.6 Device [1F:18]h Function 3 Configuration Registers

See 3.1 [Register Descriptions and Mnemonics]. See 2.8 [Configuration Space].

#### D18F3x00 Device/Vendor ID

| Bits  | Description  |
|-------|--|
| 31:16 | <b>DeviceID: device ID.</b> Read-only. Value: 1603h. |
| 15:0  | <b>VendorID: vendor ID.</b> Read-only. Value: 1022h. |

#### D18F3x04 Status/Command

| Bits  | Description  |
|-------|--|
| 31:16 | <b>Status.</b> Read-only. Reset: 0000h, except bit[20]. Bit[20] is set to indicate the existence of a PCI-defined capability block, if one exists. |
| 15:0  | <b>Command.</b> Read-only. Reset: 0000h.   |

#### D18F3x08 Class Code/Revision ID

| Bits | Description   |
|------|---|
| 31:8 | <b>ClassCode.</b> Read-only. Reset: 060000h. Provides the host bridge class code as defined in the PCI specification. |
| 7:0  | <b>RevID: revision ID.</b> Read-only. Reset: 00h.   |

#### D18F3x0C Header Type

Reset: 0080\_0000h.

| Bits | Description  |
|------|--|
| 31:0 | <b>HeaderTypeReg.</b> Read-only. These bits are fixed at their default values. The header type field indicates that there are multiple functions present in this device. |

#### D18F3x34 Capability Pointer

| Bits | Description                           |
|------|---------------------------------------|
| 31:8 | Reserved.                             |
| 7:0  | <b>CapPtr.</b> Read-only. Value: 00h. |

#### D18F3x40 MCA NB Control

| Bits | Description                               |
|------|---|
| 31:0 | See: <a href="#">MSR0000_0410</a> [31:0]. |

**D18F3x44 MCA NB Configuration**

Same-for-all. See [D18F3x180 \[Extended NB MCA Configuration\]](#). It is expected that all fields of this register are programmed to the same value in all nodes, except for the fields used for link error injection: GenLinkSel, GenSubLinkSel, GenCrcErrByte1, GenCrcErrByte0.

| Bits | Description   |
|------|---|
| 31   | <b>NbMcaLogEn: northbridge MCA log enable.</b> Read-write. Reset: 0. 1=Enables logging (but not reporting) of NB MCA errors even if MCA is not globally enabled.  |
| 30   | <b>SyncFloodOnDramAdrParErr: sync flood on DRAM address parity error.</b> Read-write. Reset: 0. BIOS: 1. 1=Enable sync flood on detection of a DRAM address parity error.   |
| 29   | <b>DisMstAbortCpuErrRsp: master abort CPU error response disable.</b> Read-write. Reset: 0. 1=Disables master abort reporting through the CPU MCA error-reporting banks; Suppresses sending of RDE to CPU; Does not log any MCA information in the NB.  |
| 28   | <b>DisTgtAbortCpuErrRsp: target abort CPU error response disable.</b> Read-write. Reset: 0. 1=Disables target abort reporting through the CPU MCA error-reporting banks; Suppresses sending of RDE to CPU; Does not log any MCA information in the NB.  |
| 27   | <b>NbMcaToMstCpuEn: machine check errors to master CPU only.</b> Read-write. Reset: 0. BIOS: 1. 1=NB MCA errors in CMP device are only reported to the node base core (NBC); the following registers are only accessible from the NBC, non-NBC writes are ignored and reads are RAZ ( <a href="#">MSR0000_0410</a> , <a href="#">MSR0000_0411</a> , and <a href="#">MSR0000_0412</a> ). This allows machine check handlers running on different cores to avoid coordinating accesses to the NB MCA registers. This field does not affect PCI-defined configuration space accesses to these registers, which are accessible from all cores. See <a href="#">3.1 [Register Descriptions and Mnemonics]</a> for a description of MSR space and <a href="#">3 [Registers]</a> for PCI-defined configuration space. 0=NB MCA errors may be reported to the core that originated the request, if applicable and known, and the NB MCA registers in MSR space are accessible from any core.<br>Note: <ul style="list-style-type: none"> <li>When the CPU which originated the request is known, it is stored in <a href="#">D18F3x4C[ErrCoreId]</a>, regardless of the setting of NbMcaToMstCpuEn. See <a href="#">Table 276</a> for errors where ErrCoreId is known.</li> <li>If IO originated the request, then the error is reported to the NBC, regardless of the setting of NbMcaToMstCpuEn.</li> </ul> |
| 26   | <b>FlagMcaCorrErr: correctable error MCA exception enable.</b> Read-write. Reset: 0. 1=Raise a machine check exception for correctable machine check errors which are enabled in <a href="#">D18F3x40</a> .   |
| 25   | <b>DisPciCfgCpuErrRsp: PCI configuration CPU error response disable.</b> Read-write. Reset: 0. 1=Disables generation of an error response to the core on detection of a master abort, target abort, or data error condition, and disables logging and reporting through the MCA error-reporting banks for PCI configuration accesses. For NB WDT errors on PCI configuration accesses, this prevents sending an error response to the core, but does not affect logging and reporting of the NB WDT error. See <a href="#">D18F3x180[DisPciCfgCpuMstAbtRsp]</a> , which applies only to master aborts.  |
| 24   | <b>IoRdDatErrEn: IO read data error log enable.</b> Read-write. Reset: 0. 1=Enables MCA logging and reporting of errors on transactions from IO devices upon detection of a target abort, master abort, or data error condition. 0=Errors on transactions from IO devices are not logged in MCA, although error responses to the requesting IO device may still be generated.   |

| 23    | <b>ChipKillEccCap: chip-kill ECC mode.</b> Read-only; updated-by-hardware. Reset: 0. 1=Chipkill ECC mode capable; ECC checking is based on x8 ECC symbols ( <a href="#">D18F3x180[EccSymbolSize]</a> ) and can be used for chipkill. 0=Chipkill ECC mode not capable; ECC checking is based on two interleaved, unganged 64/8-bit data/ECC lines and x4 ECC symbols and cannot be used for chipkill. See <a href="#">2.13.2 [DRAM Considerations for ECC]</a> .   |      |             |     |           |     |           |     |          |     |          |
|-------|---|------|-------------|-----|-----------|-----|-----------|-----|----------|-----|----------|
| 22    | <b>DramEccEn: DRAM ECC enable.</b> Read-write. Reset: 0. 1=Enables ECC check/correct mode. This bit must be set in order for ECC checking/correcting by the NB to be enabled. If set, ECC is checked and correctable errors are corrected irrespective of whether machine check ECC reporting is enabled. The hardware only allows values to be programmed into this field which are consistent with the ECC capabilities of the device as specified in <a href="#">D18F3xE8 [Northbridge Capabilities]</a> . Attempts to write values inconsistent with the capabilities results in this field not being updated. This bit does not affect ECC checking in the northbridge arrays. |      |             |     |           |     |           |     |          |     |          |
| 21    | <b>SyncFloodOnAnyUcErr: sync flood on any UC error.</b> Read-write. Reset: 0. BIOS: 1. 1=Enable sync flood of all links with sync packets on detection of any NB MCA error that is uncorrectable, including northbridge array errors and link protocol errors.  |      |             |     |           |     |           |     |          |     |          |
| 20    | <b>SyncFloodOnWDT: sync flood on watchdog timer error.</b> Read-write. Reset: 0. BIOS: 1. 1=Enable sync flood of all links with sync packets on detection of a watchdog timer error.  |      |             |     |           |     |           |     |          |     |          |
| 19:18 | <p><b>GenSubLinkSel: sublink select for CRC error generation.</b> Read-write. Reset: 0. Selects the sublink of a link selected by GenLinkSel to be used for CRC error injection through GenCrcErrByte0 and GenCrcErrByte1. When the link is ganged, GenSubLinkSel must be 00b. When the link is unganged, the following values indicate which sublink is selected:</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>Sublink 0</td></tr> <tr> <td>01b</td><td>Sublink 1</td></tr> <tr> <td>10b</td><td>Reserved</td></tr> <tr> <td>11b</td><td>Reserved</td></tr> </table>   | Bits | Description | 00b | Sublink 0 | 01b | Sublink 1 | 10b | Reserved | 11b | Reserved |
| Bits  | Description   |      |             |     |           |     |           |     |          |     |          |
| 00b   | Sublink 0   |      |             |     |           |     |           |     |          |     |          |
| 01b   | Sublink 1   |      |             |     |           |     |           |     |          |     |          |
| 10b   | Reserved  |      |             |     |           |     |           |     |          |     |          |
| 11b   | Reserved  |      |             |     |           |     |           |     |          |     |          |
| 17    | <b>GenCrcErrByte1: generate CRC error on byte lane 1.</b> Read-Write. Reset: 0. 1=For ganged links (see GenSubLinkSel), a CRC error is injected on byte lane 1 of the link specified by GenLinkSel. For ganged links in retry mode or unganged links, this field is reserved, and GenCrcErrByte0 must be used. The data carried by the link is unaffected. This bit is cleared after the error has been generated. See <a href="#">D18F0x150[ForceErrType]</a> . See <a href="#">D18F0x[14C:130][ForceRetryError]</a> for generating errors in retry mode.  |      |             |     |           |     |           |     |          |     |          |
| 16    | <b>GenCrcErrByte0: generate CRC error on byte lane 0.</b> Read-Write. Reset: 0. 1=Causes a CRC error to be injected on byte lane 0 of the link specified by GenLinkSel and the sublink specified by GenSubLinkSel. The data carried by the link is unaffected. This bit is cleared after the error has been generated. See <a href="#">D18F0x150[ForceErrType]</a> . See <a href="#">D18F0x[14C:130][ForceRetryError]</a> for generating errors in retry mode.  |      |             |     |           |     |           |     |          |     |          |
| 15:14 | <p><b>GenLinkSel: link select for CRC error generation.</b> Read-Write. Reset: 00b. Selects the link to be used for CRC error injection through GenCrcErrByte1/GenCrcErrByte0.</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>link 0</td></tr> <tr> <td>01b</td><td>link 1</td></tr> <tr> <td>10b</td><td>link 2</td></tr> <tr> <td>11b</td><td>link 3</td></tr> </table>   | Bits | Description | 00b | link 0    | 01b | link 1    | 10b | link 2   | 11b | link 3   |
| Bits  | Description   |      |             |     |           |     |           |     |          |     |          |
| 00b   | link 0  |      |             |     |           |     |           |     |          |     |          |
| 01b   | link 1  |      |             |     |           |     |           |     |          |     |          |
| 10b   | link 2  |      |             |     |           |     |           |     |          |     |          |
| 11b   | link 3  |      |             |     |           |     |           |     |          |     |          |

| 13:12       | <p><b>WDTBaseSel: watchdog timer time base select.</b> Read-write. Reset: 0. Selects the time base used by the watchdog timer. The counter selected by WDTCntSel determines the maximum count value in the time base selected by WDTBaseSel.</p> <table> <tr> <th><u>Bits</u></th><th><u>Description</u></th></tr> <tr> <td>00b</td><td>1.31 ms</td></tr> <tr> <td>01b</td><td>1.28 us</td></tr> <tr> <td>10b</td><td>Reserved.</td></tr> <tr> <td>11b</td><td>Reserved.</td></tr> </table>   | <u>Bits</u> | <u>Description</u> | 00b   | 1.31 ms | 01b   | 1.28 us | 10b   | Reserved. | 11b   | Reserved. |       |     |       |     |       |    |       |    |       |      |       |       |             |          |

#### D18F3x58 Scrub Rate Control

This register specifies the ECC sequential scrubbing rate for lines of memory and cache. See [2.9.5 \[Memory Scrubbers\]](#). Accesses to this register must first set [D18F1x10C\[DctCfgSel\]](#)=0; Accesses to this register with [D18F1x10C\[DctCfgSel\]](#)=1 are undefined; See erratum 505. Scrub rates are a platform consideration. See [2.13.1.8 \[Scrub Rate Considerations\]](#).

| 4:0   | <b>DramScrub: DRAM scrub rate.</b> See: L3Scrub. BIOS: <a href="#">2.10.5.6</a> . Specifies time between 64 B scrub events. See <a href="#">D18F3x5C</a> and <a href="#">D18F3x60</a> .    |                              |             |                    |

### D18F3x5C DRAM Scrub Address Low

In addition to sequential DRAM scrubbing, the DRAM scrubber has a redirect mode for scrubbing DRAM locations accessed during normal operation. This is enabled by setting [D18F3x5C](#)[ScrubReDirEn]. When a DRAM read is generated by any agent other than the DRAM scrubber, correctable ECC errors are corrected as the data is passed to the requestor, but the data in DRAM is not corrected if redirect scrubbing mode is disabled. In scrubber redirect mode, correctable errors detected during normal DRAM read accesses redirect the scrubber to the location of the error. After the scrubber corrects the location in DRAM, it resumes scrubbing from where it left off. DRAM scrub address registers are not modified by the redirect scrubbing mode. Sequential scrubbing and scrubber redirection can be enabled independently or together. ECC errors detected by the scrubber are logged in the MCA registers (See [D18F3x40](#) [[MCA NB Control](#)]).

| Bits | Description  |
|------|--|
| 31:6 | <b>ScrubAddr[31:6]: DRAM scrubber address bits[31:6].</b> Read-write; updated-by-hardware. ScrubAddr[47:6] = { <a href="#">D18F3x60</a> [ScrubAddr[47:32]], ScrubAddr[31:6]}. Reset: 0. ScrubAddr points to a DRAM cacheline in physical address space. BIOS should initialize the scrubber address register to the base address of the node specified by <a href="#">D18F1x</a> [ <a href="#">17C:140,7C:40</a> ] [ <a href="#">DRAM Base/Limit</a> ] prior to enabling sequential scrubbing through <a href="#">D18F3x58</a> [DramScrub]. When sequential scrubbing is enabled: it starts at the address that the scrubber address registers are initialized to; it increments through address space and updates the scrubber address registers as it does so; when the scrubber reaches the DRAM limit address specified by <a href="#">D18F1x</a> [ <a href="#">17C:140,7C:40</a> ], it wraps around to the base address. Reads of the scrubber address registers provide the next cacheline to be scrubbed. |

|     |   |
|-----|---|
| 5:1 | Reserved.   |
| 0   | <b>ScrubReDirEn: DRAM scrubber redirect enable.</b> Read-write. Reset: 0. BIOS: <a href="#">2.10.5.6</a> . If a correctable error is discovered from a non-scrubber DRAM read, then the data is corrected before it is returned to the requestor; however, the DRAM location may be left in a corrupted state (until the next time the scrubber address counts up to that location, if sequential scrubbing is enabled through <a href="#">D18F3x58</a> [DramScrub]). 1=Enables the scrubber to immediately scrub any address in which a correctable error is discovered. This bit and sequential scrubbing can be enabled independently or together; if both are enabled, the scrubber jumps from the scrubber address to where the correctable error was discovered, scrubs that location, and then jumps back to where it left off; the scrubber address register is not affected during scrubber redirection. |

### D18F3x60 DRAM Scrub Address High

| Bits  | Description  |
|-------|--|
| 31:16 | Reserved.  |
| 15:0  | <b>ScrubAddr[47:32]: DRAM scrubber address bits[47:32].</b> See: <a href="#">D18F3x5C</a> [ScrubAddr[31:6]]. Reset: 0. |

### D18F3x64 Hardware Thermal Control (HTC)

See [2.11.2.1 \[PROCHOT\\_L and Hardware Thermal Control \(HTC\)\]](#). [D18F3x64](#) should only be programmed on internal node 0 ([D18F3xE8](#)[IntNodeNum]=00b) if [D18F3xE8](#)[MultiNodeCpu]=1. If ([D18F3xE8](#)[HtcCapable]==0) then this register is reserved.

#### D18F3x74 XBAR to SRI Command Buffer Count

Read-write; Reset-applied.

**Table 213: XBAR Definitions**

| Term           | Definition   |
|----------------|--|
| <b>SpqSize</b> | Probe command queue size. SpqSize = 16.                                |
| <b>SrqSize</b> | SRQ (XBAR command and probe response to SRI) queue size. SrqSize = 44. |
| <b>PrbRsp</b>  | SRQ entries hard allocated to probe responses. PrbRsp = 4.             |

- To ensure deadlock free operation in a multinode system the following minimum buffer allocations are required:
  - ProbeCBC  $\geq$  2.
  - DnPreqCBC  $\geq$  1 if [D18F0x60](#)[NodeCnt] specifies 1 node; DnPreqCBC  $\geq$  2 if [D18F0x60](#)[NodeCnt] specifies  $\geq$  2 nodes.
  - UpPreqCBC  $\geq$  1.
  - DnReqCBC  $\geq$  1.
  - UpReqCBC  $\geq$  1.
- To ensure deadlock free operation in a single-node system the following minimum buffer allocations are required:
  - ProbeCBC  $\geq$  2
  - UpReqCBC  $\geq$  1
  - UpPreqCBC  $\geq$  1
- If [D18F0x68](#)[DispRefModeEn] is set or the node is directly connected to an IO link with an IOMMU present:
  - IsocReqCBC  $\geq$  1

- If any of the [D18F0x\[E4,C4,A4,84\]\[IsocEn\]](#) bits are set:  
IsocReqCBC >= 1
- If any of the [D18F0x\[E4,C4,A4,84\]\[IsocEn\]](#) bits are set and isochronous posted requests may be generated by the system:  
IsocPreqCBC >= 1
- The total number of SRQ (XBAR to SRI command) buffers allocated:
  - $(\text{D18F3x1A0}[\text{L3ToSriReqCBC}] + \text{PrbRsp} + \text{D18F3x74}[\text{UpReqCBC}] + \text{D18F3x74}[\text{UpPreqCBC}] + \text{D18F3x74}[\text{DnReqCBC}] + \text{D18F3x74}[\text{DnPreqCBC}] + \text{D18F3x74}[\text{IsocReqCBC}] + \text{D18F3x74}[\text{IsocPreqCBC}] + \text{D18F3x74}[\text{DRReqCBC}] + \text{D18F3x7C}[\text{Xbar2SriFreeListCBC}] + \text{D18F3x7C}[\text{SrExtFreeListBC}]) \leq \text{SrSize}.$
  - $((\text{D18F3x1A0}[\text{CpuCmdBufCnt}] * \text{NumOfCompUnitsOnNode}) + \text{PrbRsp} + \text{D18F3x74}[\text{UpReqCBC}] + \text{D18F3x74}[\text{UpPreqCBC}] + \text{D18F3x74}[\text{DnReqCBC}] + \text{D18F3x74}[\text{DnPreqCBC}] + \text{D18F3x74}[\text{IsocReqCBC}] + \text{D18F3x74}[\text{IsocPreqCBC}] + \text{D18F3x74}[\text{DRReqCBC}] + \text{D18F3x7C}[\text{Xbar2SriFreeListCBC}] + \text{D18F3x7C}[\text{SrExtFreeListBC}]) \leq \text{SrSize}.$
- The total number of SPQ (probe command) buffers allocated must satisfy the following equation:
  - $(\text{D18F3x17C}[\text{SPQPrbFreeCBC}] + \text{D18F3x74}[\text{ProbeCBC}]) \leq \text{SpqSize}.$

See [2.9.3.2.5.1 \[Recommended Buffer Count Settings Overview\]](#).

### D18F3x78 MCT to XBAR Buffer Count

Read-write; Reset-applied.

- To ensure deadlock free operation the following minimum buffer allocations are required:  
 ProbeCBC >= 1                      RspCBC >= 1                      RspDBC >= 2  
 RspDBC >= [D18F2x11C\[MctPrefReqLimit\]](#)+2
- To ensure deadlock free operation when online spare is enabled ([D18F2x\[5C:40\]\\_dct\[1:0\]\[Spare\]](#)==1) the following minimum buffer allocation is required:

RspCBC >= Dh

- The total number of command buffers allocated in this register must satisfy the following equation:
  - $(\text{D18F3x78}[\text{ProbeCBC}] + \text{D18F3x78}[\text{RspCBC}]) \leq 32$ .

### D18F3x[84:80] ACPI Power State Control

This block consists of eight identical 8-bit registers, one for each System Management Action Field (SMAF) code associated with STPCLK assertion commands from the link. Refer to the descriptions below for the associated ACPI state and system management actions for each of the 8 SMAF codes. The SmafAct fields specify the system management actions taken when the corresponding SMAF code is received. For instance, a SMAF code of 5 results in the power management actions specified by SmafAct5. Some ACPI states and associated SMAF codes may not be supported in certain conditions. See [2.5 \[Power Management\]](#) for which states are supported.

When a link STPCLK assertion command is received by the processor, the power management commands specified by the register with the corresponding SMAF code are invoked. When the STPCLK deassertion command is received by the processor, the processor returns into the operational state. If an NB COF-change command is issued (NbCofChg), the NB returns in the new NB P-state.

In multi-node systems, these registers should be programmed identically in all nodes.

**Table 214: SMAF Action Definition**

| Register                        | SmafAct  | ACPI state | Description  |
|---------------------------------|----------|------------|--|
| <a href="#">D18F3x84[31:24]</a> | SmafAct7 | C1         | Initiated when a Halt instruction is executed by processor. This does not involve the interaction with the SMC, therefore the SMC is required to never send STPCLK assertion commands with SMAF=7h.<br>• See <a href="#">2.9.5 [Memory Scrubbers]</a> for recommended clock divisor settings when memory scrubbing is enabled. |
| <a href="#">D18F3x84[23:16]</a> | SmafAct6 | S4/S5      | Initiated by a processor access to the ACPI-defined PM1_CNTa register.   |
| <a href="#">D18F3x84[15:8]</a>  | SmafAct5 | -          | Reserved.  |
| <a href="#">D18F3x84[7:0]</a>   | SmafAct4 | S3         | Initiated by a processor access to the ACPI-defined PM1_CNTa register.   |
| <a href="#">D18F3x80[31:24]</a> | SmafAct3 | S1         | Initiated by a processor access to the ACPI-defined PM1_CNTa register.   |
| <a href="#">D18F3x80[23:16]</a> | SmafAct2 | -          | Initiated by a processor for NB P-state changes. See <a href="#">2.5.2.2 [NB P-states]</a> .   |

**Table 214: SMAF Action Definition**

| Register                        | SmafAct  | ACPI state         | Description   |
|---------------------------------|----------|--------------------|---|
| <a href="#">D18F3x80</a> [15:8] | SmafAct1 | C1E, or Link init. | Initiated by an access to the ACPI-defined P_LVL3 register or in response to a write to the Link Frequency Change and Resize LDTSTOP_L Command register in the IO hub. LDTSTOP_L is expected to be asserted while in this state. See also <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> . |
| <a href="#">D18F3x80</a> [7:0]  | SmafAct0 | C2                 | Initiated by a processor access to the ACPI-defined P_LVL2 register.  |

**D18F3x80 ACPI Power State Control Low**

|     | 011b  | 256 MB             | 111b        | Reserved           |
| 0   | <b>GartEn: GART enable.</b> 1=Enables GART address translation for accesses falling within the GART aperture. <a href="#">D18F3x94</a> [GartAperBaseAddr] and other related registers should be initialized before GartEn is set. |                    |             |                    |

### D18F3x94 GART Aperture Base

Read-write; [Same-for-all](#). See [2.9.2 \[GART\]](#).

| Bits  | Description   |
|-------|---|
| 31:15 | Reserved.   |
| 14:0  | <b>GartAperBaseAddr[39:25]: GART aperture base address bits[39:25].</b> Reset: X. Specifies the base address of the GART aperture range. Based on <a href="#">D18F3x90</a> [GartSize], some of the LSB address bits are assumed to be 0 (e.g., if the GART is 1 Gbyte, then only GartAperBaseAddr[39:30] is meaningful). This field along with <a href="#">D18F3x90</a> [GartSize] specifies the GART aperture address range. BIOS can place the GART aperture below the 4-gigabyte level in address space in order to support legacy operating systems and legacy AGP cards (that do not support 64-bit address space). Note: GART apertures above 1 terabyte are not supported. |

### D18F3x98 GART Table Base

Read-write; [Same-for-all](#). See [2.9.2 \[GART\]](#).

| Bits            | Description  |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |
|-----------------|--|-----------------|--------------------|-------|------------------------------|------|------------------------------|-----|----------|---|--|---|--------------------------|
| 31:4            | <b>GartTblBaseAddr[39:12]: GART table base address bits[39:12].</b> Reset: X. Specifies the base address of the table of GART page table entries (PTEs) used in GART address translation. Accesses to the GART aperture address range specified by <a href="#">D18F3x90</a> and <a href="#">D18F3x94</a> , address GA[39:0], are translated to the physical address specified by the corresponding GART PTE. Each PTE is 32-bits wide. The first PTE corresponds to the first 4 Kbyte page of the GART aperture, and so on. PTEs are defined as follows: <table> <tr> <td><u>PTE bits</u></td><td><u>Description</u></td></tr> <tr> <td>31:12</td><td>Physical address bits[31:12]</td></tr> <tr> <td>11:4</td><td>Physical address bits[39:32]</td></tr> <tr> <td>3:2</td><td>Reserved</td></tr> <tr> <td>1</td><td>Coherent: 1=Probes are required for accesses to the range.</td></tr> <tr> <td>0</td><td>Valid: 1=Entry is valid.</td></tr> </table> | <u>PTE bits</u> | <u>Description</u> | 31:12 | Physical address bits[31:12] | 11:4 | Physical address bits[39:32] | 3:2 | Reserved | 1 | Coherent: 1=Probes are required for accesses to the range. | 0 | Valid: 1=Entry is valid. |
| <u>PTE bits</u> | <u>Description</u>   |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |
| 31:12           | Physical address bits[31:12]   |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |
| 11:4            | Physical address bits[39:32]   |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |
| 3:2             | Reserved   |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |
| 1               | Coherent: 1=Probes are required for accesses to the range.   |                 |                    |       |                              |      |                              |     |          |   |  |   |                          |

| 10    | <b>IdleExitEn: idle exit enable.</b> Read-write. Reset: 0. BIOS: 1. 1=Enable BP[5] to function as the IDLE_EXIT_L pin. See <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> .  |      |             |      |             |      |      |      |      |      |      |      |       |      |      |      |          |      |      |      |          |
| 9     | <b>SviHighFreqSel: SVI high frequency select.</b> Read-write. Cold reset: 0. 0=400 KHz. 1=3.4 MHz. Writes to this field take effect at the next SVI command boundary. If 3.4 MHz is supported by the VRM, BIOS should program this to 1 prior to any VID transitions. Once this bit is set, it should not be cleared until the next cold reset.   |      |             |      |             |      |      |      |      |      |      |      |       |      |      |      |          |      |      |      |          |
| 8     | Reserved.   |      |             |      |             |      |      |      |      |      |      |      |       |      |      |      |          |      |      |      |          |

|     |   |
|-----|---|
| 7   | <b>PsiVidEn: PSI_L VID enable.</b> Read-write. Reset: 0. This bit specifies how PSI_L is controlled. This signal may be used by the voltage regulator to improve efficiency while in reduced power states. 1=Control over the PSI_L signal is as specified by the PsiVid field of this register. 0=PSI_L is always high. See 2.5.1.4.1 [PSI_L Bit].   |
| 6:0 | <b>PsiVid: PSI_L VID threshold.</b> Read-write. Reset: 0. When enabled by PsiVidEn, this field specifies the threshold value of VID code generated by the processor, which in turn determines the state of PSI_L. When the VID code generated by the processor is less than PsiVid (i.e., the VID code is specifying a higher voltage level than the PsiVid-specified voltage level), then PSI_L is high; when the VID code is greater than or equal to PsiVid, PSI_L is driven low. See 2.5.1.4.1 [PSI_L Bit]. |

### D18F3xA4 Reported Temperature Control

The slew rate controls in this register are used to filter processor temperature measurements. Separate controls are provided for a measured temperature that is higher or lower than Tctl. The per-step timer counts as long as the measured temperature stays either above or below Tctl. Each time the measured temperature changes to the other side of Tctl, the step timer resets, and Tctl is not changed. If, for example, step times are enabled in both directions, Tctl=62.625, and the measured temperature keeps jumping quickly between 62.5 and 63.0, then (assuming the step times are long enough) Tctl would not change. However, once the measured temperature settles on one side of Tctl, Tctl can step toward the measured temperature. If the difference of measured temperature minus Tctl is greater than the value set by MaxTmpDiffUp, then Tctl is set equal to the measured temperature. See 2.11 [Thermal Functions].

|   |   |
|---|---|
| 1 | <b>SwapDone0: DCT0 swap complete.</b> Read-write; set-by-hardware. Cold reset: 0. 1=The hardware has completed copying the data to the spare rank. This bit can also be set by BIOS to immediately enable the swap to the spare rank after suspend to RAM. Once this bit is set it cannot be cleared by software. This bit cannot be set by software if DRAM is enabled <a href="#">D18F2x110</a> [DramEnable].   |
| 0 | <b>SwapEn0: DCT0 swap enable.</b> Read; write-1-only. Reset: 0. Setting this bit causes the hardware to copy the contents of the DRAM chip select identified by BadDramCs to the spare rank. The DRAM scrubber ( <a href="#">D18F3x5C</a> , <a href="#">D18F3x60</a> ) must be enabled with a scrub address range that encompasses the address of the bad chip select for the swap to occur. The scrub rate is accelerated automatically by hardware until the copy completes, at which point the scrub rate returns to normal. During the copy, DRAM accesses (including accesses to the bad CS) proceed normally. Once this bit is set, it cannot be cleared by software. |

### D18F3xB8 NB Array Address

Reset: xxxx\_xxxxh. [D18F3xB8](#) [NB Array Address] and [D18F3xBC](#) [NB Array Data Port] provide a mechanism to inject errors into DRAM and data read from internal NB arrays.

[D18F3xB8](#) should first be written with the target array and address within the array. Read and write accesses to [D18F3xBC](#) then access the target address within the target array.

### D18F3xBC NB Array Data Port

See [D18F3xB8](#) for register access information.

### D18F3xBC\_x8 DRAM ECC

This register controls injection of errors in writes to DRAM. See [2.13.3.1 \[DRAM Error Injection\]](#).

| Bits  | Description  |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |

| 19    | Reserved.  |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |
| 18    | <b>DramErrEn.</b> Read-write. Reset: 0. 1=Errors are continually injected on DRAM writes. The error injection takes place only on DRAM write accesses and should be initiated by a non-cacheable store. Errors continue to be injected on writes until this bit is cleared to a 0 by software.   |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |
| 17    | <b>EccWrReq.</b> Read; write-1-only; cleared-by-hardware. Reset: 0. 1=Error is injected on DRAM write at the bits enabled by ErrInjEn and EccVector. A single error injection takes place on the next DRAM write access and should be initiated by a non-cacheable store. This bit is cleared by hardware after the write.   |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |
| 16    | <b>EccRdReq.</b> Read; write-1-only; cleared-by-hardware. Reset: 0. 1=Indicates a DRAM ECC read is requested. The read takes place on the next DRAM read access and should be initiated by a non-cacheable load. The ECC bits read from DRAM are stored in EccVector. This bit is cleared by hardware after the read.  |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |
| 15:0  | <b>EccVector: error injection vector.</b> Read-write. Reset: x. When used in conjunction with EccWrReq, each bit of EccVector enables injecting errors to the corresponding bit within each word enabled by ErrInjEn. When used in conjunction with EccRdReq, EccVector holds the contents of the DRAM ECC bits after the read.  |     |             |     |            |     |             |     |             |     |             |     |             |     |             |     |              |     |               |     |           |

|-------|---|-------|--------------|------|-------------|-------|-------------|-------|--------------|-------|-----------|-------|-----------|-------|-------------|-------|-----------|-------|-------------|-------|-----------|-------|-------|-------|-----------|-------|-------|-------|-----------|-------|-------|-------|-----------|-------|-------|-------|-----------|
| 31    | <b>NbClkDivApplyAll.</b> Read-write. Cold reset: 0. BIOS: 1. See NbClkDiv.  |       |              |      |             |       |             |       |              |       |           |       |           |       |             |       |           |       |             |       |           |       |       |       |           |       |       |       |           |       |       |       |           |       |       |       |           |
| 30:28 | <b>NbClkDiv: NB clock divisor.</b> Read-write. Cold reset: Product-specific. BIOS: 100b. Specifies the NB CLK divisor associated with <a href="#">D18F3x[84:80] [ACPI Power State Control]</a> [NbLowPwrEn]. This divisor is applied while LDTSTOP_L is asserted if the corresponding core CLK divisor, <a href="#">D18F3x[84:80]</a> [ClkDivisor], is set to “turn off clocks” or if NBClkDivApplyAll=1; otherwise, the divisor specified by <a href="#">D18F3x[84:80]</a> [ClkDivisor] is applied. This divisor is relative to the current NB FID frequency, or: <ul style="list-style-type: none"><li>• 200 MHz * (4 + <a href="#">D18F5x1[6C:60]</a>[NbFid]).</li></ul> If <a href="#">D18F5x1[6C:60]</a> [NbDid] of the current NB P-state indicates a divisor that is lower than specified by this field, then no NB frequency change is made when entering the low-power state associated with this register (i.e., if this field specifies a divide-by 1 and the DID is divide-by 2, then the divisor remains 2 while in the low-power state). This field is encoded as follows: <table><tr><th>Bits</th><th>Description</th><th>Bits</th><th>Description</th></tr><tr><td>000b</td><td>Divide-by 1</td><td>100b</td><td>Divide-by 16</td></tr><tr><td>001b</td><td>Reserved.</td><td>101b</td><td>Reserved.</td></tr><tr><td>010b</td><td>Divide-by 4</td><td>110b</td><td>Reserved.</td></tr><tr><td>011b</td><td>Divide-by 8</td><td>111b</td><td>Reserved.</td></tr></table>  | Bits  | Description  | Bits | Description | 000b  | Divide-by 1 | 100b  | Divide-by 16 | 001b  | Reserved. | 101b  | Reserved. | 010b  | Divide-by 4 | 110b  | Reserved. | 011b  | Divide-by 8 | 111b  | Reserved. |       |       |       |           |       |       |       |           |       |       |       |           |       |       |       |           |

| 27:24 | <b>PowerStepUp.</b> Read-write. Cold reset: 0000b. Specifies the rate at which blocks of compute unit and NB logic are gated on while the processor transitions from a quiescent state to an active state as part of a power management state transition. There are about 15 steps in this transition for each compute unit and about 5 steps for the NB for the PowerStepDown and PowerStepUp transitions. So the total transition time for a single compute unit is about 15 times the time specified by PowerStepDown and PowerStepUp and the transition time for the NB is about 5 times the time specified by PowerStepDown and PowerStepUp. Use of longer transition times may help reduce voltage transients associated with power state transitions. The bits for PowerStepUp and PowerStepDown are encoded as follows: <table><tr><th>Bits</th><th>Description</th><th>Bits</th><th>Description</th></tr><tr><td>0000b</td><td>Reserved.</td><td>1000b</td><td>50 ns</td></tr><tr><td>0001b</td><td>Reserved.</td><td>1001b</td><td>Reserved.</td></tr><tr><td>0010b</td><td>Reserved.</td><td>1010b</td><td>Reserved.</td></tr><tr><td>0011b</td><td>100 ns</td><td>1011b</td><td>Reserved.</td></tr><tr><td>0100b</td><td>90 ns</td><td>1100b</td><td>Reserved.</td></tr><tr><td>0101b</td><td>80 ns</td><td>1101b</td><td>Reserved.</td></tr><tr><td>0110b</td><td>70 ns</td><td>1110b</td><td>Reserved.</td></tr><tr><td>0111b</td><td>60 ns</td><td>1111b</td><td>Reserved.</td></tr></table> <ul style="list-style-type: none"><li>• If PowerStepDown or PowerStepUp are programmed to greater than 50 ns, then the value applied to NB steps is clipped to 50 ns. | 11:8  | <p><b>ClkRampHystSel: clock ramp hysteresis select.</b> Read-write. Cold reset: 0h. BIOS: Fh. When the core(s) are in the stop-grant or Halt state and a probe request is received, the core clock may need to be brought up to service the probe.</p> <ul style="list-style-type: none"> <li>If (D18F4x128[CoreCstateMode] ? (D18F3x[84:80][CpuPrbEn]==0) : (D18F4x11[C:8][CpuPrbEn]==0)) then this field specifies how long the core clock is left up to service additional probes before being brought back down. Each time a probe request is received, the hysteresis timer is reset such that the period of time specified by this field must expire with no probe request before the core clock is brought back down. The hysteresis time is encoded as (the time base specified by D18F3xD4[ClkRampHystCtl]) * (1 + ClkRampHystSel).</li> <li>If (D18F4x128[CoreCstateMode] ? (D18F3x[84:80][CpuPrbEn]==1) : (D18F4x11[C:8][CpuPrbEn]==1)) then this field specifies a fixed amount of time to allow for probes to be serviced after completing the transition of each core. If, for example, two cores enter stop-grant or Halt at the same time, then (1) the first core would complete the transition to the low power state, (2) probe traffic would be serviced for the time specified by this field, (3) the second core would complete the transition to the low power state, and (4) probe traffic would be serviced for the time specified by this field (and afterwards, until the next power state transition). For this purpose, values range from 0h=40 ns to Fh=640 ns, encoded as 40 ns * (1 + ClkRampHystSel).</li> </ul> |      |             |     |      |     |       |     |        |     |         |

| 14:12 | <p><b>NbsynPtrAdj: NB/core synchronization FIFO pointer adjust.</b> Read-write; <a href="#">Reset-applied</a>. Cold reset: 000b. BIOS: 101b. There is a synchronization FIFO between the NB clock domain and core clock domains. At cold reset, the read pointer and write pointer for each of these FIFOs is positioned conservatively, such that FIFO latency may be greater than is necessary. This field may be used to position the read pointer and write pointer of each FIFO closer to each other such that latency is reduced. Each increment of this field represents one clock cycle of whichever is the slower clock (longer period) between the NB clock and the core clock. Values less than the recommended value are allowed; values greater than the recommended value are illegal.</p> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>6h-0h</td><td>Position the read pointer &lt;NbsynPtrAdj&gt; clock cycles closer to the write pointer</td></tr> <tr> <td>7h</td><td>Reserved</td></tr> </table> | Bits | Description | 6h-0h | Position the read pointer <NbsynPtrAdj> clock cycles closer to the write pointer | 7h   | Reserved    |      |             |      |             |      |              |      |               |      |               |      |                 |

### D18F3xE4 Thermtrip Status

| Bits | Description   |
|------|---|
| 31   | <b>SwThermtp: software THERMTRIP.</b> Write-1-only; cleared-by-hardware. Reset: 0. Writing a 1 to this bit position induces a THERMTRIP event. This bit returns 0 when read. This is a diagnostic bit, and it should be used for testing purposes only. |
| 30:6 | Reserved.   |
| 5    | <b>ThermtpEn: THERMTRIP enable.</b> Read-only. Reset: Product-specific. 1=The THERMTRIP state is supported. See 2.11.2.3 [THERMTRIP].   |

|   |   |
|---|---|
| 4 | Reserved.   |
| 3 | <b>ThermtpSense: THERMTRIP sense.</b> Read-only. Cold reset: 0. 1=The processor temperature exceeded the THERMTRIP value (regardless as to whether the THERMTRIP state is enabled). This bit is also set when the diagnostic bit SwThermtp = 1. |
| 2 | Reserved.   |
| 1 | <b>Thermtp: THERMTRIP.</b> Read-only. Cold reset: 0. 1=The processor has entered the THERMTRIP state.   |
| 0 | Reserved.   |

### D18F3xE8 Northbridge Capabilities

Read-only. Value: Product-specific. Unless otherwise specified, 1=The feature is supported by the processor; 0=The feature is not supported.

### D18F3x138 DCT0 Bad Symbol Identification

This register is set by software and read by hardware to manage history-based ECC checks during chipkill conditions. The MCT uses this information during fetches to determine if errors are correctable or uncorrectable. See 2.13.2.2 [Software Managed Bad Symbol Identification].

| Bits  | Description   |
|-------|---|
| 31    | <b>BadDramAllCsEn0:</b> bad DRAM on all chip selects, DCT0. Read-write. Reset: 0. Indicates that the symbol number specified in BadDramSymbol0 applies to all chip selects. This most likely indicates a fault outside the DRAM, since it affects all ranks.                  |
| 30:12 | Reserved.   |
| 11    | <b>BadDramCsVal0:</b> bad DRAM chip select valid, DCT0. Read-write. Reset: 0. Indicates that BadDramCs0 and BadDramSymbol0 contain valid information.   |
| 10:9  | Reserved.   |
| 8:4   | <b>BadDramSymbol0:</b> bad DRAM symbol, DCT0. Read-write. Reset: 0h. Indicates the bad symbol number within the rank. Values 0h through Fh correspond to data byte 0h through Fh, respectively. Value 10h corresponds to ECC byte 0, and value 11h corresponds to ECC byte 1. |
| 3:0   | <b>BadDramCs0:</b> bad DRAM chip select, DCT0. Read-write. Reset: 0h. Indicates the chip select value which is known bad. This chip select value identifies the rank in error.  |

### D18F3x13C DCT1 Bad Symbol Identification

See [D18F3x138 \[DCT0 Bad Symbol Identification\]](#).

| Bits  | Description  |
|-------|--|
| 31    | <b>BadDramAllCsEn1</b> : bad DRAM on all chip selects, DCT1. See: <a href="#">D18F3x138</a> [BadDramAllCsEn0]. |
| 30:12 | Reserved.  |
| 11    | <b>BadDramCsVal1</b> : bad DRAM chip select valid, DCT1. See: <a href="#">D18F3x138</a> [BadDramCsVal0].       |
| 10:9  | Reserved.  |
| 8:4   | <b>BadDramSymbol1</b> : bad DRAM symbol, DCT1. See: <a href="#">D18F3x138</a> [BadDramSymbol0].                |
| 3:0   | <b>BadDramCs1</b> : bad DRAM chip select, DCT1. See: <a href="#">D18F3x138</a> [BadDramCs0].                   |

### D18F3x140 SRI to XCS Token Count

Read-write; Reset-applied. [D18F3x140](#), [D18F3x144](#), and [D18F3x1\[54,50,4C,48\]](#) specify the number of XCS (XBAR command scheduler) entries assigned to each virtual channel within each source port. See [2.9 \[North-bridge \(NB\)\]](#). The totals of SRI, MCT and the links must not exceed the number of XCS entries. The default totals are:

- SRI: 22
- MCT: 10
- Link: 8 \* 4 (one group per link).
- Total: 64, which is the total number of entries supported by XCS.

The defaults for [D18F3x140](#), [D18F3x1\[54,50,4C,48\]](#), and [D18F3x158](#) do not allocate any tokens in the isochronous channel. If isochronous flow control mode (IFCM) is enabled ([D18F0x\[E4,C4,A4,84\]](#)[IsocEn]) or display refresh mode is enabled ([D18F0x68](#)[DispRefModeEn]), then the XCS token counts must be changed.

- If IFCM is enabled on any link, then the [D18F3x140](#)[IsocReqTok, IsocPreqTok, and IsocRspTok] must each be non-zero. Or, in display refresh mode, [D18F3x140](#)[IsocReqTok and IsocRspTok] must be non-zero. This requires tokens to be reduced elsewhere to avoid exceeding the 64 token maximum. Links which are not connected or links which are ganged include excess tokens which may be used for this purpose.
- If IFCM is enabled on any link, then it may be advantageous to allocate isochronous tokens to that link/sub-link in [D18F3x1\[54,50,4C,48\]](#). However this would result in excessive tokens for a fully populated system, especially if the links are unganged. To account for this, the processor supports IFCM being enabled on a link without allocating dedicated isochronous XCS tokens. In this case:
  - The isochronous channel uses the base channel tokens.
  - The isochronous channel has preferential access to these tokens.
- If an IOMMU is present on a link, [D18F3x1\[54,50,4C,48\]](#)[IsocReqTok] for that link must be non-zero.
- In display refresh mode, [D18F3x1\[54,50,4C,48\]](#)[IsocReqTok] and [D18F3x1\[54,50,4C,48\]](#)[IsocPreqTok] for the enabled link and [D18F3x158](#)[LnkToXcsDRToken] must be non-zero.

See [2.9.3.2.5.1 \[Recommended Buffer Count Settings Overview\]](#).

| Bits | Description   |
|------|---|
| 31:4 | Reserved.   |
| 3:0  | <b>SPQPrbFreeCBC: XBAR to SRI Probe command buffer freelist.</b> Read-write. Cold reset: 9h. Freelist entries are shared between L3 and XBAR. |

**D18F3x180 Extended NB MCA Configuration**

Reset: 0000\_0000h. This register is an extension of [D18F3x44 \[MCA NB Configuration\]](#).

| Bits  | Description   |
|-------|---|
| 31:27 | Reserved.   |
| 26    | <b>ChgUcToCeEn: change uncorrectable error to correctable error enable.</b> Read-write. 1=The status of uncorrectable errors is changed to appear as correctable errors; <a href="#">D18F3x4C[UC, PCC]</a> are cleared and a machine check exception will not be raised. For uncorrectable ECC errors, <a href="#">D18F3x4C[UECC]</a> is cleared and <a href="#">D18F3x4C[CECC]</a> is set. This field is intended for debug observability. |
| 25    | <b>EccSymbolSize: ECC symbol size and code selection.</b> Read-write. BIOS: See <a href="#">2.13.2 [DRAM Considerations for ECC]</a> . 1=x8 symbol size and code used. 0=x4 symbol size and code used.  |
| 24    | <b>McaLogErrAddrWdtErr: log error address on WDT errors.</b> Read-write. BIOS: 1. 1=When a watchdog timeout error occurs (see <a href="#">D18F3x40[WDTRptEn]</a> ), the associated address is logged and <a href="#">D18F3x4C[AddrV]</a> is set. 0=When a watchdog timeout error occurs, NB state information is saved and <a href="#">D18F3x4C[AddrV]</a> is cleared. See <a href="#">D18F3x50</a> for details on saved information.       |
| 23    | Reserved.   |
| 22    | <b>SyncFloodOnTblWalkErr: sync flood on table walk error.</b> Read-write. BIOS: 1. 1=Enable sync flood when the GART table walker encounters an uncorrectable error. A machine check exception is generated independent of the state of this bit.   |
| 21    | <b>SyncFloodOnCpuLeakErr: sync flood on CPU leak error.</b> Read-write. BIOS: 1. 1=Enable sync flood when one of the cores encounters an uncorrectable error which cannot be contained to the process on the core.  |
| 20    | <b>SyncFloodOnL3LeakErr: sync flood on L3 cache leak error.</b> Read-write. BIOS: 1. 1=Enable sync flood when the L3 cache encounters an uncorrectable error which cannot be contained to the process on one core.  |
| 19    | <b>PwP2pDatErrRmtPropDis: posted write for remote peer-to-peer data error propagation disable.</b> Read-write. 1= A peer-to-peer posted write with a data error is not propagated to the target IO link chain if the target IO link chain is not attached to the local node (the same node as the source IO link chain). Instead, the write is dropped by the host bridge. The state of this field is ignored if SyncFloodOnUsPwDatErr==1.  |
| 18    | <b>PwP2pDatErrLclPropDis: posted write for local peer-to-peer data error propagation disable.</b> Read-write. 1=A peer-to-peer posted write with a data error is not propagated to the target IO link chain if the target IO link chain is attached to the local node (the same node as the source IO link chain). Instead, the write is dropped by the host bridge. The state of this field is ignored if SyncFloodOnUsPwDatErr==1.        |
| 17:11 | Reserved.   |

|    |   |
|----|---|
| 10 | Reserved.   |
| 9  | <b>SyncFloodOnUCNbAry: sync flood on UC NB array error.</b> Read-write. BIOS: 1. 1=Enable sync flood on detection of an UC error in an NB array.  |
| 8  | <b>SyncFloodOnProtErr: sync flood on protocol error.</b> Read-write. BIOS: 1. 1=Enable sync flood on detection of link protocol error, L3 protocol error, and probe filter protocol error.  |
| 7  | <b>SyncFloodOnTgtAbortErr.</b> Read-write. BIOS: 1. 1=Enable sync flood on generated or received link responses that indicate target aborts.  |
| 6  | <b>SyncFloodOnDatErr.</b> Read-write. BIOS: 1. 1=Enable sync flood on generated or received link responses that indicate data error.  |
| 5  | <b>DisPciCfgCpuMstAbtRsp.</b> Read-write. BIOS: 1. 1=For master abort responses to CPU-initiated configuration accesses, disables MCA error reporting and generation of an error response to the core. It is recommended that this bit be set in order to avoid MCA exceptions being generated from master aborts for PCI configuration accesses, which are common during device enumeration. |
| 4  | <b>ChgMstAbortToNoErr.</b> Read-write. 1=Signal no errors instead of master abort in link response packets to IO devices on detection of a master abort condition. When ChgMstAbortToNoErr and <a href="#">D18F3x44</a> [IoMstAbortDis] are both set, ChgMstAbortToNoErr takes precedence.  |
| 3  | <b>ChgDatErrToTgtAbort.</b> Read-write. 1=Signal target abort instead of data error in link response packets to IO devices (for Gen1 link compatibility).   |
| 2  | <b>WDTCntSel[3]: watchdog timer count select bit[3].</b> Read-write. See <a href="#">D18F3x44</a> [WDTCntSel].  |
| 1  | <b>SyncFloodOnUsPwDatErr: sync flood on upstream posted write data error.</b> Read-write. BIOS: 1. 1=Enable sync flood generation when an upstream posted write data error is detected; setting of PwP2pDatErrRmtPropDis and PwP2pDatErrLclPropDis are ignored.   |
| 0  | <b>McaLogUsPwDatErrEn: MCA log of upstream posted write data error enable.</b> Read-write. 1=Enable logging of upstream posted write data errors in MCA (if NB MCA registers are appropriately enabled and configured).   |

### D18F3x188 NB Configuration 2 (NB\_CFG2)

Same-for-all.

| Bits  | Description  |
|-------|--|
| 31:10 | Reserved.  |
| 9     | <b>DisL3HiPriFreeListAlloc.</b> Read-write. Reset: 0. BIOS: 1. 1=Disables normal SRQ entry scheme which gives higher priority to L3 than XBAR. |
| 8:0   | Reserved.  |

### D18F3x190 Downcore Control

Cold reset: 0000\_0000h. See [2.4.3 \[Processor Cores and Downcoring\]](#) and [2.4.3.1 \[Software Downcoring using D18F3x190\[DisCore\]\]](#).

| Bits | Description   |
|------|---|
| 31:0 | <b>DisCore.</b> Read-write; reset-applied. 1=Disable core. 0=Core enabled. [0]=Core 0; ...; [N]=Core N. |

### D18F3x1A0 Core Interface Buffer Count

- The following buffer allocations rules must be satisfied:
  - CpuCmdBufCnt rules:
    - IF (D18F3xE8[L3Capable]==0) D18F3x1A0[CpuCmdBufCnt] >= 2.
    - IF (D18F3xE8[L3Capable]==1) D18F3x1A0[CpuCmdBufCnt] >= 1.
  - L3FreeListCBC <= (L3qSize - (CpuCmdBufCnt \* NumOfCompUnitsOnNode)).
  - L3FreeListCBC >= (CpuToNbFreeBufCnt \* NumOfCompUnitsOnNode).
  - L3ToSriReqCBC rules:
    - IF (D18F3xE8[L3Capable]==1) THEN (D18F3x1A0[L3ToSriReqCBC] >= NumOfCompUnitsOnNode).
    - IF (D18F3xE8[L3Capable]==0) D18F3x1A0[L3ToSriReqCBC] >= 0.

### D18F3x1B8 L3 Control 1

This register is reserved if the processor does not include an L3 cache. This register controls various performance modes of the L3 cache.

Block Aggressive Neighbors (BAN) is a mechanism of preventing a poor cache behaving application from displacing cache lines of good cache behaving applications in a multi-compute-unit environment. This mode is

enabled by the L3BanMode field. The mode works by computing a figure of merit (FOM) per compute-unit and an average FOM of all compute-units. The FOM is a function of hits per L3 request and L3 requests per cycle. When the ratio between the FOM for a compute-unit and the average FOM of all compute-units falls below a particular level, one of two BAN modes is engaged: full BAN and half BAN. In full BAN mode, L2 victims from that compute unit are allocated at the LRU position instead of MRU. In half BAN mode, L2 victims from that compute unit are allocated at halfway between LRU and MRU. The L3HalfBanLvl and L3FullBanLvl control bits are used to set thresholds for entering full and half BAN modes. For example the default setting for L3FullBanLvl is 0. Once the compute-unit FOM falls below 1/16 of the average FOM, full ban mode is enabled.

| Bits  | Description  |      |             |     |          |     |                  |     |                  |     |                   |
|-------|--|------|-------------|-----|----------|-----|------------------|-----|------------------|-----|-------------------|
| 31:29 | Reserved.  |      |             |     |          |     |                  |     |                  |     |                   |
| 28    | <b>ProtoErrHalt: Halt on protocol error.</b> Read-write. Reset: 0. 1=When an L3 protocol error is detected freeze the request queue (Halt request processing); block all L3 MCA error logging/reporting (but not error action). This state, when entered, can only be exited by a warm reset.  |      |             |     |          |     |                  |     |                  |     |                   |
| 27    | <b>L3ATMMModeEn.</b> Read-write; <a href="#">Same-for-all</a> . Reset: 0. BIOS: See <a href="#">2.9.4.2</a> . 1= Enable Accelerated Transition to Modified protocol in L3. This mode enables usage of a new state MuW (ModifiedUnWritten) to the existing MOESI protocol. Must be programmed to the same state as <a href="#">D18F0x68</a> [ATMMModeEn].   |      |             |     |          |     |                  |     |                  |     |                   |
| 26:23 | Reserved.  |      |             |     |          |     |                  |     |                  |     |                   |
| 22    | <b>L3HalfBanLvl: L3 block aggressive neighbors half ban level.</b> Read-write. Reset: 0. Specifies the FOM ratio to allocate an entry halfway between LRU and MRU position. 0=1/8 FOM ratio. 1=1/32 FOM ratio.   |      |             |     |          |     |                  |     |                  |     |                   |
| 21    | <b>L3FullBanLvl: L3 block aggressive neighbors full ban level.</b> Read-write. Reset: 0. Specifies the FOM ratio to allocate an entry at LRU position. 0=1/32 FOM ratio. 1=Disabled.   |      |             |     |          |     |                  |     |                  |     |                   |
| 20:19 | <b>L3BanMode: L3 block aggressive neighbors mode.</b> Read-write. Reset: 10b. Enables BAN mode and specifies the duty cycle size. A duty cycle is divided into 8 slices with BAN active on 7 slices and disabled on 1 slice. Must be disabled if L3 cache partitioning is enabled; See <a href="#">2.9.4.3 [L3 Cache Partitioning]</a> . <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>Disabled</td></tr> <tr> <td>01b</td><td>2 million cycles</td></tr> <tr> <td>10b</td><td>4 million cycles</td></tr> <tr> <td>11b</td><td>16 million cycles</td></tr> </table> | Bits | Description | 00b | Disabled | 01b | 2 million cycles | 10b | 4 million cycles | 11b | 16 million cycles |

### D18F3x1E4 SBI Control

This register specifies the behavior associated with the SIC and SID pins which may be used to support SMBus-based sideband interface (SBI) protocol. See [2.13.4 \[Sideband Interface \(SBI\)\]](#). [D18F3x1E4](#), with the exception of SbiAddr, should only be programmed on internal node 0 ([D18F3xE8\[IntNodeNum\]](#)=00b) if [D18F3xE8\[MultiNodeCpu\]](#)=1.

| Bits  | Description  |
|-------|--|
| 31    | <b>SbiRegWrDn: SBI register write complete.</b> Read-only; updated-by-hardware. Reset: 1. 1=Write to the SBI registers through <a href="#">D18F3x1EC</a> has completed. 0=Write to the SBI registers in progress.  |
| 30:12 | Reserved.  |
| 11:8  | <b>LvtOffset: local vector table offset.</b> Read-write. Cold reset: 0000b. BIOS: 3h. This specifies the address of the LVT entry in the APIC registers as follows: LVT address = (LvtOffset shifted left 4 bits) + 500h (see <a href="#">APIC[530:500]</a> ). |
| 7     | Reserved.  |

|     |  |
|-----|--|
| 6:4 | <b>SbiAddr: SMBus-based sideband interface address.</b> Read-write. Specifies bits[3:1] of the SMBus address of the processor SBI ports. SMBus address bits [3:1] = {~SA[2],SA[1:0]}. SbiAddr must be unique for all processors on the same SMBus segment.<br>Cold reset: For internal node 0, specified by the SA[2:0] strap pins (value matches the pins until the deassertion of RESET_L for a cold reset only; value is not changed by a warm reset); 000b for internal node 1 or products that do not include SA[2:0] pins. BIOS: It is recommended that BIOS program SbiAddr on internal node 1 to the same value as internal node 0 of the processor. |
| 3   | Reserved.  |
| 2   | Reserved.  |
| 1   | <b>SbRmiDis: SMBus-based sideband remote management interface disable.</b> Read-only. Reset: Product-specific. 1=The processor does not support SMBus-based SB-RMI protocol.   |
| 0   | Reserved.  |

### D18F3x1E8 SBI Address

Cold reset: 0000\_0000h. See [1.2 \[Reference Documents\]](#) for the SB-TSI and APML specs.

The SB-RMI (APML) registers can be directly accessed by the processor using [D18F3x1E8](#) and [D18F3x1EC](#). Access to these registers is accomplished as follows:

- Reads:
  - Write [D18F3x1E8](#)[SbiBankSel, SbiRegAddr].
  - Read [D18F3x1EC](#).
- Writes:
  - Write [D18F3x1E8](#)[SbiBankSel, SbiRegAddr].
  - Write [D18F3x1EC](#).

[D18F3x1E8](#) and [D18F3x1EC](#) should only be programmed on internal node 0 ([D18F3xE8](#)[IntNodeNum]=00b) if [D18F3xE8](#)[MultiNodeCpu]=1. Accesses to reserved offsets result in undefined behavior.

| Bits  | Description   |      |             |     |            |     |             |     |             |     |             |
|-------|---|------|-------------|-----|------------|-----|-------------|-----|-------------|-----|-------------|
| 31:11 | Reserved.   |      |             |     |            |     |             |     |             |     |             |
| 10:9  | <b>SbiByteCnt: SBI byte count.</b> Read-write. Specifies the number consecutive SBI registers to read or write using <a href="#">D18F3x1EC</a> .<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>1 register</td></tr> <tr> <td>01b</td><td>2 registers</td></tr> <tr> <td>10b</td><td>3 registers</td></tr> <tr> <td>11b</td><td>4 registers</td></tr> </table> | Bits | Description | 00b | 1 register | 01b | 2 registers | 10b | 3 registers | 11b | 4 registers |

## 3.7 Device [1F:18]h Function 4 Configuration Registers

See 3.1 [\[Register Descriptions and Mnemonics\]](#). See 2.8 [\[Configuration Space\]](#).

### D18F4x00 Device/Vendor ID

| Bits  | Description  |
|-------|--|
| 31:16 | <b>DeviceID: device ID.</b> Read-only. Value: 1604h. |
| 15:0  | <b>VendorID: vendor ID.</b> Read-only. Value: 1022h. |

**D18F4x04 Status/Command**

| Bits  | Description   |
|-------|---|
| 31:16 | <b>Status.</b> Read-only. Reset: 0000_0000_000X_0000b. Only Status[4] may be set to indicate the existence of a PCI-defined capability block. 0=No supported links are unganged. 1=At least one link may be unganged, in which case there is a capability block associated with sublink one of the link in this function. |
| 15:0  | <b>Command.</b> Read-only. Value: 0000h.  |

**D18F4x08 Class Code/Revision ID**

Reset: 0600\_0000h.

| Bits | Description   |
|------|---|
| 31:8 | <b>ClassCode.</b> Read-only. Provides the host bridge class code as defined in the PCI specification. |
| 7:0  | <b>RevID: revision ID.</b> Read-only.   |

**D18F4x0C Header Type**

Reset: 0080\_0000h.

| Bits | Description  |
|------|--|
| 31:0 | <b>HeaderTypeReg.</b> Read-only. These bits are fixed at their default values. The header type field indicates that there are multiple functions present in this device. |

**D18F4x34 Capabilities Pointer**

| Bits        | Description   |             |                    |     |                                 |         |          |     |                                      |         |          |     |   |         |          |     |   |         |          |     |   |         |          |

### D18F4x104 TDP Accumulator Divisor Control

| Bits  | Description  |      |             |     |             |     |             |     |             |     |            |
|-------|--|------|-------------|-----|-------------|-----|-------------|-----|-------------|-----|------------|
| 31:14 | Reserved.  |      |             |     |             |     |             |     |             |     |            |
| 13:2  | <b>TdpAccDivRate: TDP accumulator divisor rate.</b> Read-write. Reset: 0. BIOS: C8h. Specifies the rate at which the node and compute unit TDP accumulators are effected by TdpAccDivVal. A value of 0 in this field disables the actions specified by TdpAccDivVal.   |      |             |     |             |     |             |     |             |     |            |
| 1:0   | <b>TdpAccDivVal: TDP accumulator divisor value.</b> Read-write. Reset: 0. BIOS: 01b. See TdpAccDivRate.<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>Divide by 1</td></tr> <tr> <td>01b</td><td>Divide by 2</td></tr> <tr> <td>10b</td><td>Divide by 4</td></tr> <tr> <td>11b</td><td>Reset to 0</td></tr> </table> | Bits | Description | 00b | Divide by 1 | 01b | Divide by 2 | 10b | Divide by 4 | 11b | Reset to 0 |
| Bits  | Description  |      |             |     |             |     |             |     |             |     |            |
| 00b   | Divide by 1  |      |             |     |             |     |             |     |             |     |            |
| 01b   | Divide by 2  |      |             |     |             |     |             |     |             |     |            |
| 10b   | Divide by 4  |      |             |     |             |     |             |     |             |     |            |
| 11b   | Reset to 0   |      |             |     |             |     |             |     |             |     |            |

### D18F4x108 TDP Limit 1

| Bits | Description |
|------|-------------|
| 31:0 | Reserved.   |

### D18F4x10C TDP Limit 2

| Bits  | Description  |
|-------|--|
| 31:12 | Reserved.  |
| 11:0  | <b>NodeTdpLimit.</b> Read-write; <a href="#">Same-for-all</a> . Reset: Product-specific. Specifies the maximum allowed sum of TDPs from all cores on a node. If the consumed power exceeds the NodeTdpLimit, a P-state limit is applied to all cores on the processor to reduce the power consumption so that it remains within the TDP limit. If <a href="#">D18F4x15C[BoostLock]</a> =1, NodeTdpLimit can only be written with values that are less than or equal to the reset value. Attempts to write an invalid value are ignored. See <a href="#">2.5.2.1.1.1 [TDP Limiting]</a> . |

### D18F4x110 Sample and Residency Timers

| Bits  | Description  |
|-------|--|
| 31:21 | Reserved.  |
| 20:13 | <b>MinResTmr: minimum residency timer.</b> IF <a href="#">D18F4x15C[BoostLock]</a> THEN Read-only ELSE Read-write ENDIF. Reset: Product-specific. Specifies the minimum amount of time required between TDP-initiated P-state transitions. The minimum amount of time is defined as MinResTmr * (CSampleTimer + 1) . |

|      |  |
|------|--|
| 12   | Reserved.  |
| 11:0 | <b>CSampleTimer.</b> Read-write. Reset: 0. BIOS: 001h. The ApmSampleTimer and FreeRunSampleTimer rate is 5.12 us * (D18F4x110[CSampleTimer]+1). The ApmSampleTimer and FreeRunSampleTimer count down from CSampleTimer to 0 before resetting back to CSampleTimer. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> . The ApmSampleTimer is enabled if ((D18F4x110[CSampleTimer]!=0) && (D18F4x15C[ApmMasterEn]==1)). The FreeRunSampleTimer is enabled if (D18F4x110[CSampleTimer]!=0). |

### D18F4x11[C:8] C-state Control

D18F4x11[C:8] consist of three identical 16-bit registers, one for each C-state Action Field (CAF) associated with an IO address that is read to enter C-states. Refer to [2.5.3 \[C-states\]](#).

- D18F4x11[C:8][15:0] specifies the actions attempted by the core when software reads from the IO address specified by MSRC001\_0073[CstateAddr].
- D18F4x11[C:8][31:16] specifies the actions attempted by the core when software reads from the IO address specified by MSRC001\_0073[CstateAddr+1].
- D18F4x11C[15:0] specifies the actions attempted by the core when software reads from the IO address specified by MSRC001\_0073[CstateAddr+2].

### D18F4x118 C-state Control 1

Reset: 0000\_0000h. Read-write.

| Bits  | Description  |

### D18F4x128 C-state Policy Control 1

Reset: 0000\_0000h.

| Bits    | Description   |      |             |     |            |         |  |
|---------|---|------|-------------|-----|------------|---------|--|
| 31      | <b>CstateMsgDis: C-state messaging disable</b> . Read-write. Specifies whether any HT Halt entry messages are sent when a core enters a C-state. 0=Halt entry messages are sent. If <a href="#">D18F3xD4[MTC1eEn]</a> = 1, only one Halt entry message is sent from the BSP to the IO hub when all cores in the system are in a non-C0 C-state. 1=Halt entry messages are not sent. See <a href="#">2.5.3.2 [C-state Request Interface]</a> and <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> . |      |             |     |            |         |  |
| 30:21   | Reserved.   |      |             |     |            |         |  |
| 20:18   | <b>CacheFlushSucMonThreshold: cache flush success monitor threshold</b> . Read-write. BIOS: 000b. Flush the caches immediately if cache flushing is enabled and the cache flush success monitor count > CacheFlushSucMonThreshold. A value of 0 disables the cache flush success monitor. See <a href="#">D18F4x11[C:8][CacheFlushEn]</a> .   |      |             |     |            |         |  |
| 17:12   | <b>CoreStateSaveDestNode: core state save destination node</b> . IF ( <a href="#">D18F2x118[LockDramCfg]</a> ) THEN Read-only. ELSE Read-write. ENDIF. Specifies the node ID used to save the core state. See <a href="#">2.10.8 [DRAM CC6 Storage]</a> .   |      |             |     |            |         |  |
| 11:5    | <b>CacheFlushTmr: cache flush timer</b> . Read-write. BIOS: 28h. Specifies how long each core needs to stay in a C-state before it flushes its caches. See CoreCstateMode and <a href="#">D18F4x11[C:8][CacheFlushTmrSel]</a> . <table border="1"> <thead> <tr> <th>Bits</th><th>Description</th></tr> </thead> <tbody> <tr> <td>00h</td><td>&lt;= 5.12 us</td></tr> <tr> <td>7Fh-01h</td><td>(&lt;CacheFlushTmr&gt; * 10.24us) - 5.12us &lt;= Time &lt;= &lt;CacheFlushTmr&gt; * 10.24 us</td></tr> </tbody> </table>              | Bits | Description | 00h | <= 5.12 us | 7Fh-01h | (<CacheFlushTmr> * 10.24us) - 5.12us <= Time <= <CacheFlushTmr> * 10.24 us |
| Bits    | Description   |      |             |     |            |         |  |
| 00h     | <= 5.12 us  |      |             |     |            |         |  |
| 7Fh-01h | (<CacheFlushTmr> * 10.24us) - 5.12us <= Time <= <CacheFlushTmr> * 10.24 us  |      |             |     |            |         |  |
| 4:2     | <b>HaltCstateIndex</b> . Read-write. BIOS: 0. Specifies the per-core IO-based C-state that is invoked by a HLT instruction. See CoreCstateMode.   |      |             |     |            |         |  |

|   |  |
|---|--|
| 1 | <b>CoreCstatePolicy.</b> Read-write; <b>Same-for-all.</b> BIOS: 0. Specifies how the processor arbitrates voltage and frequency when different non-C0 C-state requests are received on each core in a compute unit. 0=Transition both cores to the shallower C-state request. 1=Transition both cores to the deeper C-state request. For instance, if core 0 gets a request to go to C2 and core 1 gets a request to go to C1, hardware looks at the setting of CoreCstatePolicy. If CoreCstatePolicy is programmed to 0, the processor sends both cores to C1. If CoreCstatePolicy is programmed to 1, the processor sends both cores to C2. See also <a href="#">2.5.4.1 [Dependencies Between Cores in a Compute Unit]</a> .  |
| 0 | <b>CoreCstateMode.</b> Read-write; <b>Same-for-all.</b> Specifies whether C-state actions are specified by <a href="#">D18F4x11[C:8]</a> or <a href="#">D18F3x[84:80]</a> and <a href="#">D18F3xDC[CacheFlushOnHaltCtl, CacheFlushOnHaltTmr]</a> . 0=C-state actions are specified by <a href="#">D18F4x11[C:8]</a> . HLT instructions are interpreted as the per-core IO-based C-state pointed to by HaltCstateIndex. 1=C-state actions are specified by <a href="#">D18F3x[84:80]</a> and <a href="#">D18F3xDC[CacheFlushOnHaltCtl, CacheFlushOnHaltTmr]</a> . Per-core IO-based C-state requests are interpreted as Halt special bus cycles and the power management commands specified by <a href="#">F3x84[31:24]</a> and <a href="#">D18F3xDC[CacheFlushOnHaltCtl, CacheFlushOnHaltTmr]</a> are invoked. |

### D18F4x15C Core Performance Boost Control

| Bits  | Description   |
|-------|---|
| 31    | <b>BoostLock.</b> Read-only. Reset: Product-specific. Specifies whether the following registers are Read-write, read-only, or have special requirements related to writability. See individual register definitions for details. <ul style="list-style-type: none"> <li>• <a href="#">MSRC001_00[6B:64][CpuFid, CpuDid, CpuVid]</a></li> <li>• <a href="#">D18F4x10C[NodeTdpLimit]</a></li> <li>• <a href="#">D18F4x110[MinResTmr]</a></li> <li>• <a href="#">D18F4x15C[NumBoostStates]</a></li> <li>• <a href="#">D18F4x16C[CstateCnt, CstateBoost]</a></li> </ul> |
| 30:28 | <b>TdpLimitPstate.</b> Read-write. Reset: 0. Specifies the highest performance P-state that has a power consumption less than or equal to the TDP limit. This field is programmed by BIOS and uses software P-state numbering. See <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> and <a href="#">2.5.2.1.1.2 [Notification of TDP Limit Changes]</a> .   |
| 27:8  | Reserved.   |
| 7     | <b>ApmMasterEn: APM master enable.</b> Read-write. Reset: 0. BIOS: 1. 1=Enables the ability to turn on features associated with APM when used in conjunction with the individual feature enable bits. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> .  |
| 6:5   | Reserved.   |

| 4:2  | <b>NumBoostStates: number of boosted states.</b> IF (D18F4x15C[BoostLock]   ApmMasterEn) THEN Read-only. ELSE Read-write. ENDIF. Reset: Product-specific. Specifies the number of P-states that are considered boosted P-states. See 2.5.2.1.1 [Application Power Management (APM)]. See MSRC001_0072[NumBoostStates].  |      |             |     |                   |     |                  |     |          |     |          |
|------|---|------|-------------|-----|-------------------|-----|------------------|-----|----------|-----|----------|
| 1:0  | <b>BoostSrc: boost source.</b> Read-write. Reset: 01b. BIOS: 01b. Specifies whether CPB is enabled or disabled. Under certain conditions boosting is disabled; See 2.5.2.1.9 [Processor-Systemboard Power Delivery Compatibility Check].<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>Boosting disabled</td></tr> <tr> <td>01b</td><td>Boosting enabled</td></tr> <tr> <td>10b</td><td>Reserved</td></tr> <tr> <td>11b</td><td>Reserved</td></tr> </table> | Bits | Description | 00b | Boosting disabled | 01b | Boosting enabled | 10b | Reserved | 11b | Reserved |

| 01b  | Boosting enabled  |      |             |     |                   |     |                  |     |          |     |          |
| 10b  | Reserved  |      |             |     |                   |     |                  |     |          |     |          |
| 11b  | Reserved  |      |             |     |                   |     |                  |     |          |     |          |

### D18F4x164 Fixed Errata

| Bits | Description  |
|------|--|
| 31:0 | <b>FixedErrata.</b> Value: Product-specific. See the processor revision guide for the definition of this field; see 1.2 [Reference Documents]. |

### D18F4x16C APM TDP Control

| Bits  | Description  |
|-------|--|
| 31:12 | Reserved.  |
| 11:9  | <b>CstateCnt: C-state count.</b> IF D18F4x15C[BoostLock] THEN Read-only. ELSE Read-write. ENDIF. Reset: Product-specific. Specifies the number of compute units that must be in CC6 before a transition can occur to a boosted P-state that is higher performance than the P-state specified by CstateBoost. A value of 0 disables access to P-states above CstateBoost.   |
| 8:6   | <b>CstateBoost.</b> Read-write. Reset: Product-specific. Specifies the P-state which requires the number of compute units specified in CstateCnt to be in CC6 before a transition to a higher performance (lower numbered) boosted P-state is allowed. CstateBoost must be less than or equal to D18F4x15C[NumBoostStates] otherwise undefined behavior results. If D18F4x15C[BoostLock]=1, CstateBoost can only be written with values that are greater than or equal to the reset value. Attempts to write values less than the reset value are ignored. A value of 0 indicates that the C-state boost feature is not supported. This field uses hardware P-state numbering. See 2.5.2.1.2.2 [Hardware P-state Numbering]. |
| 5     | <b>ApmTdpLimitSts: APM TDP limit status.</b> Read; set-by-hardware; write-1-to-clear. Reset: 0. This bit is set by hardware when D18F5xE8[ApmTdpLimit] changes.  |
| 4     | <b>ApmTdpLimitIntEn: APM TDP limit interrupt enable.</b> Read-write. Reset: 0. BIOS: 1. 1=Enables the generation of an interrupt using APIC330 of each core for when D18F5xE8[ApmTdpLimit] changes. See 2.5.2.1.1.2 [Notification of TDP Limit Changes].   |

### D18F4x1[98,90,88,80] Link Phy Offset

Cold reset: 8000\_0000h. The links each include an array of registers called F4x1[9C, 94, 8C, 84]\_x[NN:00], which are defined following D18F4x1[9C,94,8C,84]. These are used primarily to control link electrical parameters and to program the link BIST engine. D18F4x1[98,90,88,80] [Link Phy Offset] and

D18F4x1[9C,94,8C,84] [Link Phy Data Port] are used to access these registers.

The register number, the number that follows “\_x” in the register mnemonic, expands to 16 bit wide and is specified by D18F4x1[98,90,88,80][{UpperLinkPhyOffset, LinkPhyOffset}]. For example, to access D18F4x1[9C,94,8C,84]\_x[5:4][9:0][8,0]A\_dm[1] [Link Phy DLL Control], D18F4x1[98,90,88,80][{UpperLinkPhyOffset, LinkPhyOffset}] must be programmed as 530Ah or 520Ah.

The links also include an array of direct map registers, as indicated by the mnemonic suffix “\_dm”; alink phy register is not a direct map register if the mnemonic suffix does not end with “\_dm”. Direct map registers are accessed by D18F4x1[98,90,88,80][DirectMapEn]=1; non-direct map registers are accessed by D18F4x1[98,90,88,80][DirectMapEn]=0.

Access to these registers is accomplished as follows:

- Reads:
  - Write D18F4x1[98,90,88,80][UpperLinkPhyOffset, LinkPhyOffset, DirectMapEn] and D18F4x1[98,90,88,80][LinkPhyWrite]=0.
  - Poll D18F4x1[98,90,88,80][LinkPhyDone] until it is high.
  - Read the register contents from D18F4x1[9C,94,8C,84].
- Writes:
  - Write all 32 bits of register data to D18F4x1[9C,94,8C,84] (individual byte writes are not supported).
  - Write the register number to D18F4x1[98,90,88,80][UpperLinkPhyOffset, LinkPhyOffset, DirectMapEn] and D18F4x1[98,90,88,80][LinkPhyWrite]=1.
  - Poll D18F4x1[98,90,88,80][LinkPhyDone] until it is high to ensure that the contents of the write have been delivered to the phy.

Read or write accesses to undocumented or undefined register numbers can result in undefined behavior.

Read or write accesses to links that are not implemented on the package complete with undefined results. See 2.12.1.3.2 [Unused Links]

F4x180 and F4x184 are for link 0; F4x188 and F4x18C are for link 1; F4x190 and F4x194 are for link 2; F4x198 and F4x19C are for link 3.

| Bits  | Description  |
|-------|--|
| 31    | <b>LinkPhyDone: link phy access complete.</b> Read-only. 1=The access to one of the F4x1[9C, 94, 8C, 84]_x[NN:00] registers is complete. 0=The access is still in progress.  |
| 30    | <b>LinkPhyWrite: link phy read/write select.</b> Read-write. 0=Read one of the F4x1[9C, 94, 8C, 84]_x[NN:00] registers. 1=Write one of the F4x1[9C, 94, 8C, 84]_x[NN:00] registers.  |
| 29    | <b>DirectMapEn: direct map enable.</b> Read-write. 1=Enable link phy address direct map mode. This bit should only be set to access direct map link phy address registers as indicated by the register suffix ending with “_dm”. |
| 28:16 | Reserved.  |
| 15:10 | <b>UpperLinkPhyOffset: upper link phy offset address bits.</b> Read-write.   |

### **D18F4x1[9C,94,8C,84]\_x[D1,C1] Link Phy Receiver Loop Filter**

Table 219: [Register Mapping](#) for [D18F4x1\[9C,94,8C,84\]\\_x\[D1,C1\]](#)

| Register                                 | Function              |
|--|-----------------------|
| <a href="#">D18F4x1[9C,94,8C,84]_xC1</a> | CAD[7:0], CTL0, CLK0  |
| <a href="#">D18F4x1[9C,94,8C,84]_xD1</a> | CAD[15:8], CTL1, CLK1 |

These register bits are updated as specified by [D18F0x16C\[ImmUpdate\]](#).

**Figure 19: Link Phy Recovered Clock and Sample Clock**

When the link is in a mode that relies on dynamic phase alignment (automatic sample-clock correction), then the processor generates a recovered clock for each lane based on transitions in the lane. The ideal recovered clock transitions at exactly the same time as the transitions in the lane. Phase detection logic detects if the recovered clock transitions before or after the lane transition. The digital loop filter (DLF) is logic that adjusts the phase of the recovered clock such that its transitions match the transition time of the lane as much as possi-

ble. The DLF counts the number of times the lane transitions before the recovered clock versus after to determine whether to adjust the recovered clock phase. The DLF uses an 8-bit counter, called the loop filter counter (LFC) for this purpose. The LFC controls are included in this register. They specify DLF behavior as follows:

- LfcMax is programmed to be greater than LfcMin.
- The LFC is initialized to LfcMin.
- The LFC is updated periodically. The logic keeps a tally of the number of lane transitions occurring before and after the recovered clock transition within each update period.
- To start, if there is a net lane transition occurs after the recovered clock transition within the update period, the LFC is incremented by the net value; on the other hand, if there is a net lane transition occurs before the recovered clock transition, the LFC is decremented. However, if the LFC is ever decremented while it is zero, these rules are reversed (and the LFC is incremented instead). Thus, if there is a phase correction needed, the LFC trends either upward or downward; if it trends downward, it hits zero and then trends upward again.
- If the LFC reaches LfcMax value, then (1) the phase of the recovered clock is adjusted in the appropriate direction, (2) the LFC is set to the LfcMin value.

The LfcMin and LfcMax fields are designed to improve the stability of the recovered clock phase while improving the response time for multiple phase updates in the same direction. For example, if the recovered clock phase needs several adjustments in the same direction, then: the LFC increments until it hits LfcMax value and then be set to LfcMin (and trigger a phase adjustment); then it would increment to LfcMax value again to trigger the next phase adjustment. If, however, the next phase adjustment needs to be in the opposite direction, the LFC would decrement to zero, change direction, and then increment up to LfcMax again. In this way, phase adjustments in the same direction occur more quickly than phase adjustments in the opposite direction of the prior phase adjustment.

The nominal sample clock is offset by 90 degrees from the recovered clock. An offset can be inserted to move the sample clock from the nominal position, based on SamClkPiOffset and SamClkPiOffsetSign.

**D18F4x1[9C,94,8C,84]\_x[D3,C3] Link Phy Timing Margin**

Table 220: Register Mapping for D18F4x1[9C,94,8C,84]\_x[D3,C3]

| Register                 | Function              |
|--------------------------|-----------------------|
| D18F4x1[9C,94,8C,84]_xC3 | CAD[7:0], CTL0, CLK0  |
| D18F4x1[9C,94,8C,84]_xD3 | CAD[15:8], CTL1, CLK1 |

The built in jitter injection test mode is useful for checking the clock data recovery tracking bandwidth of the receiver. By forcing the sample clock to move from the lock position by a controlled amount and then observing the time it takes to recover, the tracking rate and bandwidth can be estimated. This register provides the control of the test mode.

The jitter injection test mode works as follows.

- The circuit is clocked by a jitter injection clock derived from dividing the link forwarded clock by 2.5; for example, if the link speed is 5.2GT/s and the link forwarded clock frequency is 2.6GHz, the jitter injection clock frequency becomes 1.04GHz.
- There are 2 phases, the on phase and the off phase. It starts with the on phase once the test mode is enabled.
- During the on phase, at every tick of jitter injection clock, the sample clock is moved away from the nominal lock position by  $1/96 \cdot UI$ .
- The direction of adjustment is specified by JitterInjDir.
- The on phase adjustment continues for a number of times as specified by JitterInjOnCnt.
- Then the adjustment turns off for a duration specified by {JitterInjOffCnt, JitterInjOnCnt} \* jitter injection clock period, this is known as the off phase. During this time, clock data recovery resumes to try to adjust the position of the sample clock back to the center of the data eye.
- The off phase is followed by the on phase again. The process continues to alternate between the on phase and the off phase until the jitter injection test mode is disabled.

In addition, the JitterInjHold bit may be set to inject a hold state at the end of the on phase. This stops clock data recovery from resuming after the on phase, hence holding the sample clock at its last adjusted position until the JitterInjHold bit is cleared. This test mode may be useful for margining the width of the input data eye.

This margining mechanism is not characterized for precision jitter adjustments or measurements.

| Bits  | Description   |
|-------|---|
| 31    | Reserved.   |
| 30    | <b>JitterInjEn: jitter injection enable.</b> Read-write. Cold reset: 0. 1=Jitter injection test mode is enabled.  |
| 29    | <b>JitterInjDir: jitter injection direction.</b> Read-write. Cold reset: 0. 0=Move clock before the nominal lock position. 1=Move clock after the nominal lock position.  |
| 28:23 | <b>JitterInjOnCnt: jitter injection on count.</b> Read-write. Cold reset: 0.  |
| 22:16 | Reserved.   |
| 15:10 | <b>JitterInjOffCnt:jitter injection off count.</b> Read-write. Cold reset: 0. The jitter injection off time count is a 12bit code, this field specifies the most significant 6 bits. The least significant 6 bits are the same as JitterInjOnCnt. |
| 9     | <b>JitterInjHold:jitter injection hold.</b> Read-write. Cold reset: 0. 1=Jitter injection hold is enabled.  |

| D18F4x1[9C,94,8C,84]_xC4 | CAD[7:0], CTL0, CLK0  |
| D18F4x1[9C,94,8C,84]_xD4 | CAD[15:8], CTL1, CLK1 |

If there is a requirement to optimize performance on a per-lane basis, see

[D18F4x1\[9C,94,8C,84\]\\_x\[5:4\]\[9:0\]\[8,0\]6\\_dm\[1\]](#). These register bits are updated as specified by [D18F0x16C\[ImmUpdate\]](#).

The processor supports decision feedback restore (DFR), a function that enables on-chip AC coupling on the receiver path in Gen3 DC-coupled mode, to improve the receiver's ability to operate over a longer channel. In this mode, the receiver on the processor must be programmed with the expected peak single-ended DC voltage level over the single-ended DC common mode voltage level, as seen by the receiver, when a static 1 or 0 is driven. For example, without deemphasis at nominal supply voltage of 1.2V, the peak single ended voltage is expected to be 300mV ideally above the single ended DC common mode voltage level. The value is dependent on the deemphasis setting of the transmitter on the other end of the channel. BIOS should initialize DCV as follows.

Table 222: BIOS Recommendations for D18F4x1[9C,94,8C,84]\_x[D4,C4][DCV]

| Far-device deemphasis setting | DCV |
|-------------------------------|-----|
| No deemphasis                 | 4Dh |
| -2dB postcursor               | 3Dh |
| -3dB postcursor               | 36h |
| -5dB postcursor               | 2Bh |
| -6dB postcursor               | 27h |
| -7dB postcursor               | 22h |
| -8dB postcursor               | 1Fh |
| -9dB postcursor               | 1Bh |
| -11dB postcursor              | 16h |

Decision feedback equalization (DFE) can be enabled to enhance Gen3 link operation. Once enabled, the receiver uses the logic level of the previous data bit to adjust the voltage threshold of the sampler in the direction that causes the sampler to switch sooner when the data bit transitions to the opposite logic level for the next bit. The control and DFE voltage level are included in this register.

**D18F4x1[9C,94,8C,84]\_x[DF,CF] Link FIFO Read Pointer Optimization**Table 224: [Register Mapping](#) for D18F4x1[9C,94,8C,84]\_x[DF,CF]

| Register                 | Function              |
|--------------------------|-----------------------|
| D18F4x1[9C,94,8C,84]_xCF | CAD[7:0], CTL0, CLK0  |
| D18F4x1[9C,94,8C,84]_xDF | CAD[15:8], CTL1, CLK1 |

There is a synchronization FIFO between the NB clock domain and each of the link clock domains. At cold reset, the read pointer and write pointer for each of these FIFOs is positioned conservatively (30 bit-times apart), such that FIFO latency may be greater than is necessary. This register may be used to position the read pointer and write pointer of each FIFO closer to each other such that latency is reduced. Each of the fields of this register specify the number of positions to move read pointer closer to the write pointer.

During normal operation, VDDNB can be changed; a reduction in VDDNB while the transmitter is running can result in a FIFO underrun as the write pointer slows down. Hardware can automatically offset the pointers according to the values specified in this register to compensate for the VDDNB changes to prevent the FIFO underrun issue. This register provides the capability to uniquely program the pointer separation for each of the 4 PStates; P0XmtRdPtr and P0RcvRdPtr for P0 P-state which corresponds to the highest VDDNB power state for maximum performance, P3XmtRdPtr and P3RcvRdPtr for P3 P-state which corresponds to the lowest VDDNB power state, and P1 and P2 for the 2 intermediate PStates.

After writing to this register, the new values are applied to the FIFOs each time the link disconnects and reconnects, including warm resets and LDTSTOP\_L assertions. If there is a transition to a higher P-state, the Rcv and Xmt pointer adjust register settings for the higher P-state to be transitioned into is applied. If there is a transition to a lower P-state or no transition, the Rcv and Xmt pointer adjust register settings for the P0 P-state is applied. Typically, the RCV FIFO Async tracking logic can compensate for any decrease in VDDNB during normal operation; hence, all 4 of the RcvRdPtr settings are expected to be the same. Async clocking mode does not move the pointers closer than programmed, it only allows them to keep the programmed separation when the received clock is faster or slower than the transmit clock.

Reads from the P0XmtRdPtr and P0RcvRdPtr after a write but before the link disconnects and reconnects, returns the current value, not the pending value from the last write. Reads from P1XmtRdPtr, P1RcvRdPtr, P2XmtRdPtr, P2RcvRdPtr, P3XmtRdPtr and P3RcvRdPtr always returns 0h.

**D18F4x1[9C,94,8C,84]\_x[5:4][9:0][8,0]6\_dm[1] Link Phy DFE and DFR Control**

This is a direct map register set; see [D18F4x1\[98,90,88,80\]\[DirectMapEn\]](#). The definition of this register is similar to that of [D18F4x1\[9C,94,8C,84\]\\_x\[D4,C4\]](#). This register provides per-lane programmability whereas [D18F4x1\[9C,94,8C,84\]\\_x\[D4,C4\]](#) only allows per-sublink wide programmability.

Accessing any register number that is not listed above might result in undefined behavior of the phy. This register is not applicable for clock lanes.

BIOS sets {D11ProcessFreqCtlOverride, D11ProcessFreqCtlIndex2} according to the following pseudocode at a **Gen1** frequency and prior to the warm reset to transition to a **Gen3** frequency:

- Temp[3:0] = Lookup in Table 233. The row is selected by the value of D18F0x[E8,C8,A8,88][Freq]. IF (D18F5x190[31:0]==0000\_0000h) THEN the left value column of constants is selected ELSE the right column of values from D18F5x190 is selected.
- For each link, 0 to 3, and for each sublink if unganged and the sublinks of the link differ in frequency:
  - IF (LinkGang || (Unganged and both sublinks at same frequency)) THEN
    - Sign = D18F4x1[9C,94,8C,84]\_x4011\_dm[1][FuseProcD11ProcessComp[2]]. (CADIN[0])
    - Offset[1:0] = D18F4x1[9C,94,8C,84]\_x4011\_dm[1][FuseProcD11ProcessComp[1:0]]. (CADIN[0])
  - ELSE // (unganged and both sublinks at different frequency)
    - Sign = D18F4x1[9C,94,8C,84]\_x4[4,0]11\_dm[1][FuseProcD11ProcessComp[2]]. (CADIN[8,0])
    - Offset[1:0] = D18F4x1[9C,94,8C,84]\_x4[4,0]11\_dm[1][FuseProcD11ProcessComp[1:0]]. (CADIN[8,0])
  - TempData[31:0] = D18F4x1[9C,94,8C,84]\_x400F\_dm[1][31:0]. (CADIN[0])
  - TempData[12] = 1. (D11ProcessFreqCtlOverride)
  - IF (Sign) THEN // Subtract offset
    - IF (Temp[3:0]<{00,Offset[1:0]}) THEN
      - AdjTemp[3:0] = 0h.
    - ELSE
      - AdjTemp[3:0] = (Temp[3:0]-{00,Offset[1:0]}).
  - ELSE // Sign==0, Add offset
    - IF ((Temp[3:0]+{00,Offset[1:0]})>Fh) THEN
      - AdjTemp[3:0] = Fh.
    - ELSE
      - AdjTemp[3:0] = (Temp[3:0]+{00,Offset[1:0]}).
  - TempData[3:0] = AdjTemp[3:0]. (D11ProcessFreqCtlIndex2)
  - IF (LinkGang || (Unganged and both sublinks at same frequency)) THEN

- D18F4x1[9C,94,8C,84]\_x500F\_dm[1][31:0] = TempData[31:0]. (Broadcast, 16-bit)
- ELSE // (unganged and both sublinks at different frequency)
  - D18F4x1[9C,94,8C,84]\_x5[3:2]0F\_dm[1][31:0] = TempData[31:0]. (Broadcast, 8-bit)

| D18F4x1[9C,94,8C,84]_x6984_dm1 | CLKOUT[1] |

Accessing any register number that is not listed above might result in undefined behavior of the phy. These register bits are updated as specified by D18F0x16C[ImmUpdate].

This register is not applicable for CAD/CTL lanes.

| Bits | Description   |
|------|---|
| 31:1 | Reserved.   |
| 0    | <b>Tx90En: transmit clock 90 degree phase shift enable.</b> Read-write. Cold reset: 1. 1=Enable 90 degree phase shift on transmit clock lanes relative to CAD/CTL lanes. 0=Clock and CAD/CTL lanes are transmitted in phase. This feature might help reduce cross-talk. |

### **D18F4x1[9C,94,8C,84]\_x[7:6][9:0][8,0]C\_dm[1] Link Phy Tx Deemphasis and Margin Test Control**

This is a direct map register set; see D18F4x1[98,90,88,80][DirectMapEn]. These registers specify the deemphasis values as well as provide test and debug features control associated with the link transmit lanes.

Accessing any register number that is not listed above might result in undefined behavior of the phy.

This register specifies the deemphasis and voltage margining settings for the transmit drivers. See [2.12.3 \[Equalization\]](#) for more information about deemphasis. Links connecting internal nodes as specified by [D18F0x1A0\[IntLnkRoute\]](#) do not require deemphasis. These register bits are updated as specified by [D18F0x16C\[ImmUpdate\]](#).

For Gen3 links, the fields in this register can be programmed during link initialization to select the right deemphasis setting as follows.

**Table 241: Gen3 Deemphasis Settings**

| Gen3 Deemphasis <sup>1</sup> Setting   | Post1 | Pre1 | Post2 | Margin |
|--|-------|------|-------|--------|
| No Deemphasis (0 dB)   | 0     | 0    | 0     | 0      |
| -3 dB postcursor   | 38    | 0    | 0     | 0      |
| -6 dB postcursor   | 64    | 0    | 0     | 0      |
| -8 dB postcursor   | 77    | 0    | 0     | 0      |
| -11 dB postcursor  | 92    | 0    | 0     | 0      |
| -11 dB postcursor with -8 dB precursor <sup>2</sup>  | 77    | 15   | 0     | 0      |
| 1. Deemphasis is not supported by the transmit clock lanes.<br>2. This setting is expected to be used for links with very high loss. |       |      |       |        |

Deemphasis is not supported when operating at Gen1 link frequencies. Post1, Post2, and Pre1 must be 0 for Gen1 links.

[Table 242](#) and [Table 243](#) show recommended deemphasis settings for systems that have not been fully modeled and can also be used as estimates to begin margining work.

**Table 242: Estimated deemphasis (dB) for microstrip routing**

| Length of trace (in) | Frequency of operation (GHz) |  |  |     |     |     |
|----------------------|------------------------------|--|--|-----|-----|-----|
|                      | 3.2                          | 2.6  | 2.4  | 2.2 | 2.0 | 1.8 |
| 4                    | -3                           | 0 <sup>1</sup> /-3 <sup>2</sup> /-3 <sup>3</sup> | 0 <sup>1</sup> /0 <sup>2</sup> /-3 <sup>3</sup>  | 0   | 0   | 0   |
| 5                    | -3                           | -3   | 0 <sup>1</sup> /-3 <sup>2</sup> /-3 <sup>3</sup> | 0   | 0   | 0   |
| 6                    | -3                           | -3   | -3   | 0   | 0   | 0   |

| Bits  | Description   |
|-------|---|
| 31:24 | <b>Post2: deemphasis post-cursor level 2.</b> Read-write. Cold reset: 0. Specifies the relative strength the post cursor 2 deemphasis tap. Value must be less than or equal to 104. BIOS: See <a href="#">Table 241 [Gen3 Deemphasis Settings]</a> .  |
| 23:16 | <b>Post1: deemphasis post-cursor level 1.</b> Read-write. Cold reset: 38. Specifies the relative strength the post cursor 1 deemphasis tap. Value must be less than or equal to 104. BIOS: See <a href="#">Table 241 [Gen3 Deemphasis Settings]</a> . |
| 15:8  | <b>Pre1: deemphasis pre-cursor level 1.</b> Read-write. Cold reset: 0. Specifies the relative strength the pre cursor deemphasis tap. Value must be less than or equal to 104. BIOS: See <a href="#">Table 241 [Gen3 Deemphasis Settings]</a> .       |
| 7:0   | <b>Margin.</b> Read-write. Cold reset: 0. Specifies the relative strength the margin tap. Value must be less than or equal to 104. BIOS: See <a href="#">Table 241 [Gen3 Deemphasis Settings]</a> .   |

**D18F4x1B8 Processor TDP**

See [MSRC001\\_0077](#) for converting TDP to watts.

| Bits  | Description  |
|-------|--|
| 31:16 | <b>BaseTdp.</b> Read-only. Value: Product-specific. Specifies the maximum TDP consumed by the processor for NB and logic external to the core. If <a href="#">D18F3xE8[MultiNodeCpu]=1</a> , this field reflects the maximum TDP consumed by the Northbridge and logic external to the core on both nodes. See <a href="#">MSRC001_0077[BaseTdp]</a> . |
| 15:0  | <b>ProcessorTdp.</b> Read-only. Value: Product-specific. Specifies the maximum TDP the processor can support. See <a href="#">MSRC001_0077[ProcessorTdp]</a> .   |

**D18F4x1C4 L3 Power Control**

| Bits | Description |
|------|-------------|
| 31:9 | Reserved.   |

| 8       | <b>L3PwrSavEn: L3 power savings enable.</b> Read-write. Reset: 0. BIOS: 1. 1=The clock to idle sub-caches in the L3 is stopped.   |      |             |     |          |     |   |     |   |         |               |     |    |         |          |     |          |

## 3.8 Device [1F:18]h Function 5 Configuration Registers

See [3.1 \[Register Descriptions and Mnemonics\]](#). See [2.8 \[Configuration Space\]](#).

**D18F5x00 Device/Vendor ID**

| Bits  | Description  |
|-------|--|
| 31:16 | <b>DeviceID: device ID.</b> Read-only. Value: 1605h. |
| 15:0  | <b>VendorID: vendor ID.</b> Read-only. Value: 1022h. |

**D18F5x04 Status/Command**

| Bits  | Description                              |
|-------|--|
| 31:16 | <b>Status.</b> Read-only. Value: 0000h.  |
| 15:0  | <b>Command.</b> Read-only. Value: 0000h. |

**D18F5x08 Class Code/Revision ID**

| Bits | Description   |
|------|---|
| 31:8 | <b>ClassCode.</b> Read-only. Value: 060000h. Provides the host bridge class code as defined in the PCI specification. |
| 7:0  | <b>RevID: revision ID.</b> Read-only. Value: 00h.   |

**D18F5x0C Header Type**

Reset: 0080\_0000h.

| Bits | Description  |
|------|--|
| 31:0 | <b>HeaderTypeReg.</b> Read-only. These bits are fixed at their default values. The header type field indicates that there are not multiple functions present in this device. |

**D18F5x34 Capabilities Pointer**

| Bits | Description   |
|------|---|
| 31:8 | Reserved.   |
| 7:0  | <b>CapPtr: capabilities pointer.</b> Read-only. Value: 00h. |

**D18F5x[70,60,50,40] Northbridge Performance Event Select Low**

| Bits | Description                                       |
|------|---|
| 31:0 | See: <a href="#">MSRC001_024[6,4,2,0][31:0]</a> . |

**D18F5x[74,64,54,44] Northbridge Performance Event Select High**

| Bits | Description  |
|------|--|
| 31:0 | See: <a href="#">MSRC001_024[6,4,2,0][63:32]</a> . |

**D18F5x[78,68,58,48] Northbridge Performance Event Counter Low**

| Bits | Description                                       |
|------|---|
| 31:0 | See: <a href="#">MSRC001_024[7,5,3,1][31:0]</a> . |

**D18F5x[7C,6C,5C,4C] Northbridge Performance Event Counter High**

| Bits | Description  |
|------|--|
| 31:0 | See: <a href="#">MSRC001_024[7,5,3,1][63:32]</a> . |

**D18F5x80 Compute Unit Status**

Read-only. See [2.4.3 \[Processor Cores and Downcoring\]](#). Reset: Product-specific.

Software associates core ID to the cores of the compute units according to the following table. All combinations not listed are reserved.

**Table 244: D18F5x80[Enabled, DualCore] Definition**

| Enabled | DualCore | Definition  |
|---------|----------|---|
| 1h      | 1h       | 1 compute unit is enabled; both cores of the compute unit are enabled.    |
| 3h      | 3h       | 2 compute units are enabled; both cores of each compute unit are enabled. |
| 7h      | 7h       | 3 compute units are enabled; both cores of each compute unit are enabled. |
| Fh      | Fh       | 4 compute units are enabled; both cores of each compute unit are enabled. |

| Bits  | Description  |     |             |     |                |     |                |     |                |     |                |

### D18F5x84 Northbridge Capabilities 2

Read-only. Value: Product-specific. Unless otherwise specified, 1=The feature is supported by the processor; 0=The feature is not supported.

| Bits  | Description   |
|-------|---|
| 31:29 | Reserved.   |
| 28:24 | <b>DdrMaxRateEnf: enforced maximum DDR rate.</b> See: DdrMaxRate. Specifies the maximum DRAM data rate that the processor is designed to support. Writes to <a href="#">D18F2x94_dct[1:0][MemClkFreq]</a> that specify a frequency greater than specified by DdrMaxRateEnf will result in the <a href="#">D18F2x94_dct[1:0][MemClkFreq]</a> being set to DdrMaxRateEnf. |
| 23:21 | Reserved.   |
| 20:16 | <b>DdrMaxRate: maximum DDR rate.</b> Specifies the maximum DRAM data rate that the processor is designed to support. See: <a href="#">Table 160 [Valid Values for D18F2x94_dct[1:0][MemClkFreq]]</a> ; except 00h is defined as no limit. See <a href="#">D18F2x94_dct[1:0][MemClkFreq]</a> and <a href="#">D18F5x84[DdrMaxRateEnf]</a> .                               |
| 15:14 | Reserved.   |
| 13:12 | <b>DctEn: DCT enabled.</b> Specifies which DCT controllers are enabled. [0]=DCT0. [1]=DCT1. 1=Enabled. 0=Disabled.  |
| 11:8  | Reserved.   |
| 7:0   | <b>CmpCap: CMP capable.</b> Number of cores on the node is CmpCap+1-(the number of cores disabled by <a href="#">D18F3x190[DisCore]</a> ), as CmpCap is unaffected by <a href="#">D18F3x190[DisCore]</a> . See <a href="#">2.4.3 [Processor Cores and Downcoring]</a> .   |

### D18F5x88 NB Configuration 4 (NB\_CFG4)

| Bits  | Description   |
|-------|---|
| 31:10 | Reserved.   |
| 9     | <b>DisHintInHtMskCnt.</b> Read-write. Reset: 0. 1=Force HT Msk/Cnt to 0. 0=Allow HT Msk/Cnt to be non-0; used to contain core prefetch hints.   |
| 8:7   | Reserved.   |
| 6     | <b>EnLnkTriStateNbPstate.</b> Read-write. Cold Reset: 0. BIOS: 1. 1= <a href="#">D18F0x[E4,C4,A4,84][LdtStopTriEn]</a> applies for LDTSTOPS for NB P-State changes. 0= <a href="#">D18F0x[E4,C4,A4,84][LdtStopTriEn]</a> is ignored for LDTSTOPS for NB P-State changes; LDTSTOP_L assertion leaves the link transmitter signals in L0; receivers enabled after LDTSTOP_L deassertion based on internal timing. This field only applies to links operating at Gen1 frequencies. |

### D18F5xE0 Processor TDP Running Average

See [MSRC001\\_0078](#).

| Bits  | Description  |
|-------|--|
| 31:26 | Reserved.  |
| 25:4  | <b>TdpRunAvgAccCap: processor TDP running average accumulator capture.</b> Read-only; updated-by-hardware. Reset: 0. Specifies the captured two's complement signed value of the processor TDP running average accumulator. The processor TDP running average accumulator is reset to 0 once the value is captured into TdpRunAvgAccCap or when <a href="#">D18F5xE8[ApmTdpLimit]</a> changes. See <a href="#">RunAvgRange</a> .   |
| 3:0   | <b>RunAvgRange: running average range.</b> Read-write; <a href="#">Same-for-all</a> . Reset: 0. BIOS: Eh. Specifies the bit that the internal FreeRunSampleTimer must overflow to cause the processor TDP running average accumulator value to be captured into TdpRunAvgAccCap. The time interval is specified as $2^{(\text{RunAvgRange} + 1)} \times \text{FreeRunSampleTimer rate}$ . A value of 0 disables the TDP running average accumulator capture function. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> . |

### D18F5xE8 TDP Limit 3

| Bits  | Description  |
|-------|--|
| 31:29 | Reserved.  |
| 28:16 | <b>ApmTdpLimit.</b> Read-only; updated-by-hardware. If the consumed node power exceeds the ApmTdpLimit on a single node processor or the ApmTdpLimit/2 on a multi-node processor, a P-state limit is applied to all cores on all nodes to reduce the power consumption to remain within the TDP limit. See <a href="#">2.5.2.1.1.1 [TDP Limiting]</a> and <a href="#">MSRC001_0078[ApmTdpLimit]</a> .<br>Value:<br>$(\text{MSRC001\_0075}[\text{ApmlTdpLimit}] == 0) \\ ? (\text{D18F4x10C}[\text{NodeTdpLimit}] * (\text{D18F3xE8}[\text{MultiNodeCpu}] + 1)) \\ : \text{MIN}((\text{D18F4x10C}[\text{NodeTdpLimit}] * (\text{D18F3xE8}[\text{MultiNodeCpu}] + 1)), \\ \text{MSRC001\_0075}[\text{ApmlTdpLimit}]).$ |
| 15:10 | <b>Tdp2Watt[5:0].</b> Read-only. Value: 000000b. See <a href="#">Tdp2Watt[15:6]</a> .  |
| 9:0   | <b>Tdp2Watt[15:6].</b> Read-only. Value: Product-specific. Specifies in watts/TDP units the conversion factor for converting TDP units to watts. Tdp2Watt[15:0] is a fixed point integer with 16 bits to the right of the decimal point and 0 bits to the left of the decimal point. E.g. Tdp2Watt[15] == 0.5 W; Tdp2Watt[6] == 0.976 mW; Tdp2Watt[0] == 15.2 uW.  |

**D18F5x128 Clock Power/Timing Control 3**

| Bits  | Description   |      |  |      |             |     |           |     |   |     |           |     |  |

**D18F5x1[6C:60] Northbridge P-state [3:0]**

Cold reset: Product-specific. Each of these registers specify the frequency and voltage associated with each of the NB P-states.

Table 245: [Register Mapping](#) for D18F5x1[6C:60]

| Register  | Function     |
|-----------|--------------|
| D18F5x160 | NB P-state 0 |
| D18F5x164 | NB P-state 1 |
| D18F5x168 | Reserved     |
| D18F5x16C | Reserved     |

The NbVid field is allowed to be different between processors in a multi-processor system. All other fields are required to be programmed to the same value for all processors in the coherent fabric. See 2.5.2.2 [NB P-states] for more information about these registers.

**Table 246: NB P-state Definitions**

| Term            | Definition   |
|-----------------|--|
| <b>NBCOF</b>    | NB current operating frequency in MHz. $NBCOF = 200 * (D18F5x1[6C:60][NbFid] + 4h) / (2^{D18F5x1[6C:60][NbDid]})$ .                |
| <b>NBCOF[0]</b> | NB current operating frequency in MHz for NB P-state 0.<br>$NBCOF[0] = (200 * (D18F5x160[NbFid] + 4h) / (2^{D18F5x160[NbDid]}))$ . |
| <b>NBCOF[1]</b> | NB current operating frequency in MHz for NB P-state 1.<br>$NBCOF[1] = (200 * (D18F5x164[NbFid] + 4h) / (2^{D18F5x164[NbDid]}))$ . |

| Bits  | Description  |
|-------|--|
| 31:17 | Reserved.  |
| 16:10 | <b>NbVid: NB VID.</b> Read-write. Specifies the NB voltage. Writes outside the <a href="#">MSRC001_0071</a> [MaxVid, MinVid] range are ignored.  |
| 9:8   | Reserved.  |
| 7     | <b>NbDid: NB divisor ID.</b> Read-write; <a href="#">Same-for-all</a> . Specifies the NB frequency divisor; see NbFid.   |
| 6     | Reserved.  |
| 5:1   | <b>NbFid: NB frequency ID.</b> Read-write; <a href="#">Same-for-all</a> . Specifies the NB frequency multiplier. The NB COF is a function of NbFid and NbDid, and defined by <a href="#">NBCOF</a> . NbFid and NbDid are not changed on a write if the value written results in a frequency greater than <a href="#">MSRC001_0071</a> [MaxNbCof]. NbFid must be less than or equal to 1Bh. |
| 0     | <b>NbPstateEn: NB P-state enable.</b> Read-write; <a href="#">Same-for-all</a> . 1=The NB P-state specified by this register is valid. 0=The NB P-state specified by this register is not valid. See <a href="#">D18F5x170</a> [NbPstateMaxVal].   |

### D18F5x170 Northbridge P-state Control

See also [2.5.2.2 \[NB P-states\]](#).

| Bits  | Description  |
|-------|--|
| 31:16 | Reserved.  |
| 15    | Reserved.  |
| 14    | <b>SwNbPstateLoDis: software NB P-state low disable.</b> IF ( <a href="#">MSRC001_0071</a> [NbPstateDis]) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0. BIOS: 0. 1=Transition to NbPstateHi and disable transitions to NbPstateLo.   |
| 13    | <b>NbPstateDisOnP0: NB P-state disable on P0.</b> IF ( <a href="#">MSRC001_0071</a> [NbPstateDis]) THEN Read-only. ELSE Read-write. ENDIF. Reset: 0. BIOS: 0. 1=Transition to NbPstateHi and disable transitions to NbPstateLo if any compute unit is in P0 or a boosted P-state. This field uses software P-state numbering. See <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . |
| 12    | Reserved.  |
| 11:9  | <b>NbPstateThreshold: NB P-state threshold.</b> Read-write. Reset: Product-specific. BIOS: <a href="#">NumOf-CompUnitsOnNode</a> . Specifies the minimum number of compute units that must be in a P-state with <a href="#">MSRC001_00[6B:64]</a> [NbPstate]=1 before transitions to lower performance NB P-states are allowed. See NbPstateLo and NbPstateHi.                               |
| 8     | Reserved.  |

|     |   |
|-----|---|
| 7:6 | <b>NbPstateHi: NB P-state high.</b> Read-write; <a href="#">Same-for-all</a> . Cold reset: Product-specific. If NB P-states are enabled, this field specifies the NB P-state that is used when the number of compute units in a P-state with <a href="#">MSRC001_00[6B:64][NbPstate]=1</a> is less than NbPstateThreshold. This field is not changed on a write if the value written is greater than the NbPstateMaxVal value written or greater than the current NbPstateLo value. See also NbPstateDisOnP0, SwNbPstateLoDis, NbPstateLo, <a href="#">D18F5x174[NbPstateDis]</a> , and <a href="#">D18F5x1[6C:60][NbPstateEn]</a> .  |
| 5   | Reserved.   |
| 4:3 | <b>NbPstateLo: NB P-state low.</b> Read-write; <a href="#">Same-for-all</a> . Cold reset: Product-specific. If NB P-states are enabled, this field specifies the NB P-state that is used when the number of compute units in a P-state with <a href="#">MSRC001_00[6B:64][NbPstate]=1</a> is greater than or equal to NbPstateThreshold. NbPstateLo must be greater than or equal to NbPstateHi. This field is not changed on a write if the value written is greater than the NbPstateMaxVal value written or less than the current NbPstateHi value. See also NbPstateDisOnP0, SwNbPstateLoDis, <a href="#">D18F5x174[NbPstateDis]</a> , and <a href="#">D18F5x1[6C:60][NbPstateEn]</a> . |
| 2   | Reserved.   |
| 1:0 | <b>NbPstateMaxVal: NB P-state maximum value.</b> Read-write. Cold reset: specified by the reset state of <a href="#">D18F5x1[6C:60][NbPstateEn]</a> ; the cold reset value is the highest NB P-state number corresponding to the register in which NbPstateEn is set (e.g., if D18F5x160 and D18F5x164 have this bit set and the others do not, then NbPstateMaxVal=1; if NbPstateEn is only set in D18F5x160, then NbPstateMaxVal=0). This specifies the highest NB P-state value (lowest performance state) supported by the hardware.  |

### D18F5x174 Northbridge P-state Status

**D18F5x194 Name String Address Port**

[D18F5x194](#) and [D18F5x198](#) provide BIOS with a read-only name string that may be copied to [MSRC001\\_00\[35:30\]](#) at warm reset. Each of [D18F5x198\\_x\[B:0\]](#) is read as follows:

1. Write [D18F5x194\[Index\]](#).
2. Read [D18F5x198](#).

| Bits  | Description  |      |             |       |   |       |          |

| 7:0   | <b>NameStringByte0: name string ASCII character 0</b> . |

**3.9 APIC Registers**

See [2.4.8.1.2 \[APIC Register Space\]](#).

MMIO local APIC space is accessible in xAPIC mode.

### APIC20 APIC ID

| Bits  | Description  |
|-------|--|
| 31:24 | <b>ApicId: APIC ID.</b> Read-write. Reset: Varies based on core number and node number. <ul style="list-style-type: none"> <li>• If <a href="#">~D18F3xE8[MultiNodeCpu]</a> then the initial value of ApicId[7:0]={0b, <a href="#">D18F0x60[NodeId[2:0]]</a>, CpuCoreNum[3:0]}.</li> <li>• If <a href="#">D18F3xE8[MultiNodeCpu]</a> then the initial value of ApicId[7:0]={0b, <a href="#">D18F0x60[NodeId[2:1]]</a>, CpuCoreNum[4:0]}.</li> </ul> See <a href="#">2.4.8.1.3 [ApicId Enumeration Requirements]</a> . See <a href="#">2.4.3 [Processor Cores and Downcoring]</a> . |
| 23:0  | Reserved.  |

### APIC30 APIC Version

| Bits  | Description  |
|-------|--|
| 31    | <b>ExtApicSpace: extended APIC register space present.</b> Read-only. Reset: 1. 1=Indicates the presence of extended APIC register space starting at <a href="#">APIC400</a> . |
| 30:25 | RAZ.   |
| 24    | <b>DirectedEoiSupport: directed EOI support.</b> Read-only. Reset: 0. 0=Directed EOI capability not supported.   |
| 23:16 | <b>MaxLvtEntry.</b> Read-only. Reset: Product-specific. Specifies the number of entries in the local vector table minus one.   |
| 15:8  | RAZ.   |
| 7:0   | <b>Version.</b> Read-only. Reset: 10h. Indicates the version number of this APIC implementation.   |

### APIC80 Task Priority (TPR)

| Bits | Description   |
|------|---|
| 31:8 | RAZ.  |
| 7:0  | <b>Priority.</b> Read-write. Reset: 0. This field is assigned by software to set a threshold priority at which the core is interrupted. |

### APIC90 Arbitration Priority (APR)

| Bits | Description  |
|------|--|
| 31:8 | RAZ.   |
| 7:0  | <b>Priority.</b> Read-only. Reset: 0. Indicates the current priority for a pending interrupt, or a task or interrupt being serviced by the core. The priority is used to arbitrate between cores to determine which accepts a lowest-priority interrupt request. |

**APICA0 Processor Priority (PPR)**

| Bits | Description   |
|------|---|
| 31:8 | RAZ.  |
| 7:0  | <b>Priority.</b> Reset: 0. Read-only. Indicates the core's current priority servicing a task or interrupt, and is used to determine if any pending interrupts should be serviced. It is the higher value of the task priority value and the current highest in-service interrupt. |

**APICB0 End of Interrupt**

This register is written by the software interrupt handler to indicate the servicing of the current interrupt is complete.

| Bits | Description           |
|------|-----------------------|
| 31:0 | Reserved. Write-only. |

**APICC0 Remote Read**

| Bits | Description  |
|------|--|
| 31:0 | <b>RemoteReadData.</b> Read-only. Reset: 0. The data resulting from a valid completion of a remote read inter-processor interrupt. |

**APICD0 Logical Destination (LDR)**

| Bits  | Description  |
|-------|--|
| 31:24 | <b>Destination.</b> Read-write. Reset: 0. This APIC's destination identification. Used to determine which interrupts should be accepted. |
| 23:0  | Reserved.  |

**APICE0 Destination Format**

Only supported in xAPIC mode.

| Bits  | Description  |      |             |    |                                   |       |          |    |                                |
|-------|--|------|-------------|----|-----------------------------------|-------|----------|----|--------------------------------|
| 31:28 | <b>Format.</b> Read-write. Reset: Fh. Controls which format to use when accepting interrupts with a logical destination mode.<br><table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>0h</td><td>Logical Cluster Destination Mode.</td></tr> <tr> <td>Eh-1h</td><td>Reserved</td></tr> <tr> <td>Fh</td><td>Logical Flat Destination Mode.</td></tr> </table> | Bits | Description | 0h | Logical Cluster Destination Mode. | Eh-1h | Reserved | Fh | Logical Flat Destination Mode. |
| Bits  | Description  |      |             |    |                                   |       |          |    |                                |
| 0h    | Logical Cluster Destination Mode.  |      |             |    |                                   |       |          |    |                                |
| Eh-1h | Reserved   |      |             |    |                                   |       |          |    |                                |
| Fh    | Logical Flat Destination Mode.   |      |             |    |                                   |       |          |    |                                |
| 27:0  | Reserved. Reset: FFF_FFFh.   |      |             |    |                                   |       |          |    |                                |

**APICF0 Spurious-Interrupt Vector (SVR)**

| Bits  | Description  |
|-------|--|
| 31:13 | RAZ.   |
| 12    | <b>EoiBroadcastDisable: EOI broadcast disable.</b> Read-only. Reset: 0.  |
| 11:10 | RAZ.   |
| 9     | <b>FocusDisable.</b> Read-write. Reset: 0. 1=Disable focus core checking during lowest-priority arbitrated interrupts.   |
| 8     | <b>APICSWEn: APIC software enable.</b> Read-write. Reset: 0. 0=SMI, NMI, INIT, and Startup interrupts may be accepted; pending interrupts in <a href="#">APIC[170:100]</a> and <a href="#">APIC[270:200]</a> are held, but further fixed, lowest-priority, LINT[1:0], and ExtInt interrupts are not accepted. All LVT entry mask bits are set and cannot be cleared. |
| 7:0   | <b>Vector.</b> Read-write. Reset: FFh. The vector that is sent to the core in the event of a spurious interrupt. The behavior of bits 3:0 are controlled as specified by <a href="#">D18F0x68 [Link Transaction Control][Api-cExtSpur]</a> .   |

**APIC[170:100] In-Service (ISR)**

The in-service registers provide a bit per interrupt to indicate that the corresponding interrupt is being serviced by the core. APIC100[15:0] are reserved. Interrupts are mapped as follows:

Table 247: [Register Mapping](#) for [APIC\[170:100\]](#)

| Register | Function             |
|----------|----------------------|
| APIC100  | Interrupts [31:16]   |
| APIC110  | Interrupts [63:32]   |
| APIC120  | Interrupts [95:64]   |
| APIC130  | Interrupts [127:96]  |
| APIC140  | Interrupts [159:128] |
| APIC150  | Interrupts [191:160] |
| APIC160  | Interrupts [223:192] |
| APIC170  | Interrupts [255:224] |

| Bits | Description   |
|------|---|
| 31:0 | <b>InServiceBits.</b> Reset: 0. Read-only. These bits are set when the corresponding interrupt is being serviced by the core. |

**APIC[1F0:180] Trigger Mode (TMR)**

The trigger mode registers provide a bit per interrupt to indicate the assertion mode of each interrupt. APIC180[15:0] are reserved. Interrupts are mapped as follows:

Table 248: [Register Mapping](#) for APIC[1F0:180]

| Register | Function             |
|----------|----------------------|
| APIC180  | Interrupts [31:16]   |
| APIC190  | Interrupts [63:32]   |
| APIC1A0  | Interrupts [95:64]   |
| APIC1B0  | Interrupts [127:96]  |
| APIC1C0  | Interrupts [159:128] |
| APIC1D0  | Interrupts [191:160] |
| APIC1E0  | Interrupts [223:192] |
| APIC1F0  | Interrupts [255:224] |

| Bits | Description   |
|------|---|
| 31:0 | <b>TriggerModeBits</b> . Reset: 0. Read-only. The corresponding trigger mode bit is updated when an interrupt is accepted. The values are: 0=Edge-triggered interrupt. 1=Level-triggered interrupt. |

### APIC[270:200] Interrupt Request (IRR)

The interrupt request registers provide a bit per interrupt to indicate that the corresponding interrupt has been accepted by the APIC. APIC200[15:0] are reserved. Interrupts are mapped as follows:

Table 249: [Register Mapping](#) for APIC[270:200]

| Register | Function             |
|----------|----------------------|
| APIC200  | Interrupts [31:16]   |
| APIC210  | Interrupts [63:32]   |
| APIC220  | Interrupts [95:64]   |
| APIC230  | Interrupts [127:96]  |
| APIC240  | Interrupts [159:128] |
| APIC250  | Interrupts [191:160] |
| APIC260  | Interrupts [223:192] |
| APIC270  | Interrupts [255:224] |

| Bits | Description   |
|------|---|
| 31:0 | <b>RequestBits</b> . Read-only. Reset: 0. The corresponding request bit is set when the an interrupt is accepted by the APIC. |

### APIC280 Error Status

Writes to this register trigger an update of the register state. The value written by software is arbitrary. Each write causes the internal error state to be loaded into this register, clearing the internal error state. Consequently, a second write prior to the occurrence of another error causes the register to be overwritten with cleared data.

| Bits | Description |
|------|-------------|
| 31:8 | RAZ.        |

|     |   |
|-----|---|
| 7   | <b>IllegalRegAddr: illegal register address.</b> Read-write. Reset: 0. This bit indicates that an access to a nonexistent register location within this APIC was attempted. Can only be set in xAPIC mode.      |
| 6   | <b>RcvdIllegalVector: received illegal vector.</b> Read-write. Reset: 0. This bit indicates that this APIC has received a message with an illegal vector (00h to 0Fh for fixed and lowest priority interrupts). |
| 5   | <b>SentIllegalVector.</b> Read-write. Reset: 0. This bit indicates that this APIC attempted to send a message with an illegal vector (00h to 0Fh for fixed and lowest priority interrupts).                     |
| 4   | RAZ.  |
| 3   | <b>RcvAcceptError: receive accept error.</b> Read-write. Reset: 0. This bit indicates that a message received by this APIC was not accepted by this or any other APIC.  |
| 2   | <b>SendAcceptError.</b> Read-write. Reset: 0. This bit indicates that a message sent by this APIC was not accepted by any APIC.   |
| 1:0 | RAZ.  |

### APIC300 Interrupt Command Low (ICR Low)

Not all combinations of ICR fields are valid. Only the following combinations are valid:

**Table 250: ICR valid combinations**

| Message Type                    | Trigger Mode | Level  | Destination Shorthand              |
|---------------------------------|--------------|--------|------------------------------------|
| Fixed                           | Edge         | x      | x                                  |
|                                 | Level        | Assert | x                                  |
| Lowest Priority, SMI, NMI, INIT | Edge         | x      | Destination or all excluding self. |
|                                 | Level        | Assert | Destination or all excluding self  |
| Startup                         | x            | x      | Destination or all excluding self  |

Note: x indicates a don't care.

| Bits        | Description  |             |                    |     |                                  |     |      |     |                    |     |  |

| 011b  | Remote read.   |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |
| 100b  | NMI  |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |
| 101b  | INIT   |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |
| 110b  | Startup  |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |
| 111b  | External interrupt.  |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |
| 7:0   | <b>Vector.</b> Read-write. Reset: 0. The vector that is sent for this interrupt source.  |      |             |      |                  |      |                  |      |  |      |              |      |     |      |      |      |         |      |                     |

### APIC310 Interrupt Command High (ICR High)

| Bits  | Description  |
|-------|--|
| 31:24 | <b>DestinationField.</b> Read-write. Reset: 0. The destination encoding used when <a href="#">APIC300[DestShrthnd]</a> is 00b. |
| 23:0  | RAZ.   |

### APIC320 LVT Timer

| Bits  | Description   |
|-------|---|
| 31:18 | RAZ.  |
| 17    | <b>Mode.</b> Read-write. Reset: 0. 0=One-shot. 1=Periodic.  |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.  |
| 15:13 | RAZ.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.) |

|      |  |
|------|--|
| 11   | RAZ.   |
| 10:8 | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> . |
| 7:0  | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.  |

### APIC330 LVT Thermal Sensor

Interrupts for this local vector table are caused by changes in [MSRC001\\_0071\[CurPstateLimit\]](#) due to SB-RMI, software P-state limit, or HTC.

| Bits  | Description   |
|-------|---|
| 31:17 | RAZ.  |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.  |
| 15:13 | RAZ.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.) |
| 11    | RAZ.  |
| 10:8  | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> .  |
| 7:0   | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.   |

### APIC340 LVT Performance Monitor

Interrupts for this local vector table are caused by overflows of:

- [MSRC001\\_00\[07:04\] \[Performance Event Counter \(PERF\\_CTR\[3:0\]\)\]](#).
- [MSRC001\\_020\[B,9,7,5,3,1\] \[Performance Event Counter \(PERF\\_CTR\[5:0\]\)\]](#).
- [MSRC001\\_024\[7,5,3,1\] \[Northbridge Performance Event Counter \(NB\\_PERF\\_CTR\[3:0\]\)\]](#).

The Mask bit is not set automatically when the interrupt is taken.

| Bits  | Description   |
|-------|---|
| 31:17 | RAZ.  |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.  |
| 15:13 | RAZ.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.) |
| 11    | RAZ.  |
| 10:8  | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> .  |
| 7:0   | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.   |

### APIC3[60:50] LVT LINT[1:0]

Table 251: [Register Mapping](#) for APIC3[60:50]

| Register | Function |
|----------|----------|
| APIC350  | LINT 0   |
| APIC360  | LINT 1   |

| Bits  | Description  |
|-------|--|
| 31:17 | RAZ.   |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.   |
| 15    | <b>TM: trigger mode.</b> Read-write. Reset: 0. 0=Edge. 1=Level.  |
| 14    | <b>RmtIRR.</b> Read-only; updated-by-hardware. Reset: 0. If trigger mode is level, remote IRR is set when the interrupt has begun service. Remote IRR is cleared when the end of interrupt has occurred. |
| 13    | Reserved.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.)                            |
| 11    | RAZ.   |
| 10:8  | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> .   |
| 7:0   | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.  |

### APIC370 LVT Error

| Bits  | Description   |
|-------|---|
| 31:17 | RAZ.  |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.  |
| 15:13 | RAZ.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.) |
| 11    | RAZ.  |
| 10:8  | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> .  |
| 7:0   | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.   |

### APIC380 Timer Initial Count

| Bits | Description  |
|------|--|
| 31:0 | <b>Count.</b> Read-write. Reset: 0. The value copied into the current count register when the timer is loaded or reloaded. |

### APIC390 Timer Current Count

| Bits | Description  |
|------|--|
| 31:0 | <b>Count.</b> Read-only. Reset: 0. The current value of the counter. |

### APIC3E0 Timer Divide Configuration

The Div bits are encoded as follows:

**Table 252: Div[3,1:0] Value Table**

| Div[3] | Div[1:0] | Resulting Timer Divide |
|--------|----------|------------------------|
| 0      | 00b      | 2                      |
| 0      | 01b      | 4                      |
| 0      | 10b      | 8                      |
| 0      | 11b      | 16                     |
| 1      | 00b      | 32                     |
| 1      | 01b      | 64                     |
| 1      | 10b      | 128                    |
| 1      | 11b      | 1                      |

| Bits | Description   |
|------|---|
| 31:4 | RAZ.  |
| 3    | <b>Div[3]</b> . Read-write. Reset: 0. See <a href="#">Table 252</a> .   |
| 2    | RAZ.  |
| 1:0  | <b>Div[1:0]</b> . Read-write. Reset: 0. See <a href="#">Table 252</a> . |

### APIC400 Extended APIC Feature

| Bits  | Description   |
|-------|---|
| 31:24 | RAZ.  |
| 23:16 | <b>ExtLvtCount: extended local vector table count</b> . Read-only. Reset: 04h. This specifies the number of extended LVT registers ( <a href="#">APIC[530:500]</a> ) in the local APIC.                               |
| 15:3  | RAZ.  |
| 2     | <b>ExtApicIdCap: extended APIC ID capable</b> . Read-only. Reset: 1. 1=The processor is capable of supporting an 8-bit APIC ID, as controlled by <a href="#">APIC410[ExtApicIdEn]</a> .                               |
| 1     | <b>SeoiCap: specific end of interrupt capable</b> . Read-only. Reset: 1. 1=The <a href="#">APIC420 [Specific End Of Interrupt]</a> is present.  |
| 0     | <b>IerCap: interrupt enable register capable</b> . Read-only. Reset: 1. This bit indicates that the <a href="#">APIC[4F0:480] [Interrupt Enable]</a> are present. See <a href="#">2.4.8.1.8 [Interrupt Masking]</a> . |

### APIC410 Extended APIC Control

| Bits | Description  |
|------|--|
| 31:3 | RAZ.   |
| 2    | <b>ExtApicIdEn: extended APIC ID enable</b> . Read-write. Reset: 0. 1=Enable 8-bit APIC ID; <a href="#">APIC20[ApicId]</a> supports an 8-bit value; an interrupt broadcast in physical destination mode requires that the <a href="#">IntDest[7:0]=1111_1111b</a> (instead of <a href="#">xxxx_1111b</a> ); a match in physical destination mode occurs when ( <a href="#">IntDest[7:0] == ApicId[7:0]</a> ) instead of ( <a href="#">IntDest[3:0] == ApicId[3:0]</a> ). If <a href="#">ExtApicIdEn=1</a> then program <a href="#">D18F0x68[ApicExtId]=1</a> and <a href="#">D18F0x68[ApicExtBrdCst]=1</a> . |

|   |  |
|---|--|
| 1 | <b>SeoiEn.</b> Read-write. Reset: 0. 1=Enable SEOI generation when a write to <a href="#">APIC420 [Specific End Of Interrupt]</a> is received. |
| 0 | <b>IerEn.</b> Read-write. Reset: 0. 1=Enable writes to the interrupt enable registers.   |

### APIC420 Specific End Of Interrupt

| Bits | Description   |
|------|---|
| 31:8 | RAZ.  |
| 7:0  | <b>EoiVec: end of interrupt vector.</b> Read-write. Reset: 0. A write to this field causes an end of interrupt cycle to be performed for the vector specified in this field. The behavior is undefined if no interrupt is pending for the specified interrupt vector. |

### APIC[4F0:480] Interrupt Enable

Interrupt enables range is mapped as follows:

Table 253: [Register Mapping](#) for [APIC\[4F0:480\]](#)

| Register | Function       |
|----------|----------------|
| APIC480  | IntEn[31:0]    |
| APIC490  | IntEn[63:32]   |
| APIC4A0  | IntEn[95:64]   |
| APIC4B0  | IntEn[127:96]  |
| APIC4C0  | IntEn[159:128] |
| APIC4D0  | IntEn[191:160] |
| APIC4E0  | IntEn[223:192] |
| APIC4F0  | IntEn[255:224] |

| Bits | Description   |
|------|---|
| 31:0 | <b>InterruptEnableBits.</b> Read-write. Reset: FFFF_FFFFh. The interrupt enable bits can be used to enable each of the 256 interrupts. See above table. |

### APIC[530:500] Extended Interrupt [3:0] Local Vector Table

APIC500 provides a local vector table entry for IBS; See [D18F3x1CC](#). APIC510 provides a local vector table entry for thresholding; See [D18F3x160](#), [D18F3x168](#), and [D18F3x170](#). APIC510 provides a local vector table entry for thresholding; See [D18F3x160](#), [D18F3x168](#), and [D18F3x170](#). APIC520 is unused. APIC530 provides a local vector table entry for SBI; See [D18F3x1E4](#).

Table 254: [Register Mapping](#) for [APIC\[530:500\]](#)

| Register | Function                            |
|----------|-------------------------------------|
| APIC500  | Extended Interrupt 0 (IBS)          |
| APIC510  | Extended Interrupt 1 (Thresholding) |
| APIC520  | Extended Interrupt 2 (Unused)       |
| APIC530  | Extended Interrupt 3 (SBI)          |

| Bits  | Description   |
|-------|---|
| 31:17 | RAZ.  |
| 16    | <b>Mask.</b> Read-write. Reset: 1. 0=Not masked. 1=Masked.  |
| 15:13 | RAZ.  |
| 12    | <b>DS: interrupt delivery status.</b> Read-only; updated-by-hardware. Reset: 0. 0=Idle. 1=Send pending. (Indicates that the interrupt has not yet been accepted by the core.) |
| 11    | RAZ.  |
| 10:8  | <b>MsgType: message type.</b> Read-write. Reset: 000b. See <a href="#">2.4.8.1.14 [Generalized Local Vector Table]</a> .  |
| 7:0   | <b>Vector.</b> Read-write. Reset: 00h. Interrupt vector number.   |

### 3.10 CPUID Instruction Registers

Processor feature capabilities and configuration information are provided through the CPUID instruction. The information is accessed by (1) selecting the CPUID function setting EAX and optionally ECX for some functions, (2) executing the CPUID instruction, and (3) reading the results in the EAX, EBX, ECX, and EDX registers. The syntax *CPUID FnXXXX\_XXXX\_EiX[\_xYYY]* refers to the function where EAX==X, and optionally ECX==Y, and the registers specified by EiX. EiX can be any single register such as {EAX, EBX, ECX, and EDX}, or a range of registers, such as E[C,B,A]X. Undefined function numbers return 0's in all 4 registers. See [2.4.10 \[CPUID Instruction\]](#).

Unless otherwise specified, single-bit feature fields are encoded as 1=Feature is supported by the processor; 0=Feature is not supported by the processor.

The following provides processor specific details about CPUID. See the *CPUID Specification* for further information.

#### CPUID Fn0000\_0000\_EAX Processor Vendor and Largest Standard Function Number

| Bits | Description   |
|------|---|
| 31:0 | <b>LFuncStd: largest standard function.</b> Value: 0000_000Dh. The largest CPUID standard function input value supported by the processor implementation. |

#### CPUID Fn0000\_0000\_E[D,C,B]X Processor Vendor

[CPUID Fn0000\\_0000\\_E\[D,C,B\]X](#) and [CPUID Fn8000\\_0000\\_E\[D,C,B\]X](#) return the same value.

Table 255: [Reset Mapping](#) for [CPUID Fn0000\\_0000\\_E\[D,C,B\]X](#)

| Register              | Value      | Description                     |
|-----------------------|------------|---------------------------------|
| CPUID Fn0000_0000_EBX | 6874_7541h | The ASCII characters “h t u A”. |
| CPUID Fn0000_0000_ECX | 444D_4163h | The ASCII characters “D M A c”. |
| CPUID Fn0000_0000_EDX | 6974_6E65h | The ASCII characters “i t n e”. |

| Bits | Description  |
|------|--|
| 31:0 | <b>Vendor.</b> The 12 8-bit ASCII character codes to create the string “AuthenticAMD”. |

**CPUID Fn0000\_0001\_EAX Family, Model, Stepping Identifiers**

CPUID Fn0000\_0001\_EAX, CPUID Fn8000\_0001\_EAX are an alias of D18F3xFC.

**Family** is an 8-bit value and is defined as: **Family[7:0]** = ({0000b, BaseFamily[3:0]} + ExtendedFamily[7:0]). E.g. If BaseFamily[3:0]=Fh and ExtendedFamily[7:0]=06h, then Family[7:0]=15h.

**Model** is an 8-bit value and is defined as: **Model[7:0]** = {ExtendedModel[3:0], BaseModel[3:0]}. E.g. If ExtendedModel[3:0]=Eh and BaseModel[3:0]=8h, then Model[7:0] = E8h. Model numbers vary with product.

| Bits | Description        |
|------|--------------------|
| 31:0 | Alias of D18F3xFC. |

**CPUID Fn0000\_0001\_EBX LocalApicId, LogicalProcessorCount, CLFlush**

| Bits  | Description  |
|-------|--|
| 31:24 | <b>LocalApicId: initial local APIC physical ID.</b> The initial APIC20[ApicId] value. After D18F0x60[NodeId] has been initialized, changes to APIC20[ApicId] do not affect the value of this CPUID register. See 2.4.3 [Processor Cores and Downcoring]. |
| 23:16 | <b>LogicalProcessorCount: logical processor count.</b> If CPUID Fn0000_0001_EDX[HTT] = 1, then this field indicates the number of cores in the processor as CPUID Fn8000_0008_ECX[NC] + 1. Otherwise, this field is reserved. Value: Product-specific.   |
| 15:8  | <b>CLFlush: CLFLUSH size in quadwords.</b> Value: 08h.   |
| 7:0   | <b>8BitBrandId: 8 bit brand ID.</b> Value: 00h. Indicates that the brand ID is in CPUID Fn8000_0001_EBX.   |

**CPUID Fn0000\_0001\_ECX Feature Identifiers**

These values can be over-written by MSRC001\_1004.

| Bits | Description   |
|------|---|
| 31   | RAZ. Reserved for use by hypervisor to indicate guest status.   |
| 30   | Reserved.   |
| 29   | <b>F16C: half-precision convert instruction support.</b> Value: 0.  |
| 28   | <b>AVX: AVX instruction support.</b> Value: 1.  |
| 27   | <b>OSXSAVE: OS enabled support for XGETBV/XSETBV.</b> 1=The OS has enabled support for XGETBV/XSETBV instructions to query processor extended states.                               |
| 26   | <b>XSAVE: XSAVE (and related) instruction support.</b> Value: 1. 1=Support provided for the XSAVE, XRESTOR, XSETBV, and XGETBV instructions and the XFEATURE_ENABLED_MASK register. |
| 25   | <b>AES: AES instruction support.</b> Value: Product-specific.   |
| 24   | Reserved.   |
| 23   | <b>POPCNT: POPCNT instruction.</b> Value: 1.  |
| 22   | Reserved.   |
| 21   | <b>x2APIC: x2APIC capability.</b> Value: 0.   |

| Bits  | Description  |
|-------|--|
| 20    | <b>SSE42: SSE4.2 instruction support.</b> Value: 1.  |
| 19    | <b>SSE41: SSE4.1 instruction support.</b> Value: 1.  |
| 18:14 | Reserved.  |

For CPUID Fn0000\_000D, if ECX>2 and ECX<62 then EAX/EBX/ECX/EDX will return 0.

**CPUID Fn0000\_000D\_EAX\_x3E Processor Extended State Enumeration (ECX=62)**

| Bits | Description   |
|------|---|
| 31:0 | <b>LwpSaveStateSize:</b> LWP save state byte size. Value: 0000_0080h. |

**CPUID Fn0000\_000D\_EBX\_x3E Processor Extended State Enumeration (ECX=62)**

| Bits | Description   |
|------|---|
| 31:0 | <b>LwpSaveStateOffset:</b> LWP save state byte offset. Value: 0000_0340h. |

**CPUID Fn0000\_000D\_ECX\_x3E Processor Extended State Enumeration (ECX=62)**

| Bits | Description |
|------|-------------|
| 31:0 | Reserved.   |

**CPUID Fn0000\_000D\_EDX\_x3E Processor Extended State Enumeration (ECX=62)**

| Bits | Description |
|------|-------------|
| 31:0 | Reserved.   |

For CPUID Fn0000\_000D, if ECX>62 then EAX/EBX/ECX/EDX will return 0.

**CPUID Fn8000\_0000\_EAX Largest Extended Function Number**

| Bits | Description   |
|------|---|
| 31:0 | <b>LFuncExt: largest extended function.</b> Value: 8000_001Eh. The largest CPUID extended function input value supported by the processor implementation. |

**CPUID Fn8000\_0000\_E[D,C,B]X Processor Vendor**

CPUID Fn0000\_0000\_E[D,C,B]X and CPUID Fn8000\_0000\_E[D,C,B]X return the same value.

Table 256: Reset Mapping for CPUID Fn8000\_0000\_E[D,C,B]X

| Register              | Value      | Description                     |
|-----------------------|------------|---------------------------------|
| CPUID Fn8000_0000_EBX | 6874_7541h | The ASCII characters “h t u A”. |
| CPUID Fn8000_0000_ECX | 444D_4163h | The ASCII characters “D M A c”. |
| CPUID Fn8000_0000_EDX | 6974_6E65h | The ASCII characters “i t n e”. |

| Bits | Description  |
|------|--|
| 31:0 | <b>Vendor.</b> The 12 8-bit ASCII character codes to create the string “AuthenticAMD”. |

**CPUID Fn8000\_0001\_EAX Family, Model, Stepping Identifiers**

CPUID Fn0000\_0001\_EAX, CPUID Fn8000\_0001\_EAX are an alias of D18F3xFC.

**Family** is an 8-bit value and is defined as: **Family[7:0]** = ({0000b, BaseFamily[3:0]} + ExtendedFamily[7:0]). E.g. If BaseFamily[3:0]=Fh and ExtendedFamily[7:0]=06h, then Family[7:0]=15h.

**Model** is an 8-bit value and is defined as: **Model[7:0]** = {ExtendedModel[3:0], BaseModel[3:0]}. E.g. If ExtendedModel[3:0]=Eh and BaseModel[3:0]=8h, then Model[7:0] = E8h. Model numbers vary with product.

| Bits | Description        |

| CPUID Fn8000_0003_EDX | MSRC001_0033[63:32] |
| CPUID Fn8000_0004_EAX | MSRC001_0034[31:0]  |
| CPUID Fn8000_0004_EBX | MSRC001_0034[63:32] |
| CPUID Fn8000_0004_ECX | MSRC001_0035[31:0]  |
| CPUID Fn8000_0004_EDX | MSRC001_0035[63:32] |

| Bits | Description  |
|------|--|
| 31:0 | <b>ProcName: processor name.</b> These return the ASCII string corresponding to the processor name, stored in <a href="#">MSRC001_00[35:30]</a> [ <a href="#">Processor Name String</a> ]. |

### CPUID Fn8000\_0005\_EAX L1 TLB 2M/4M Identifiers

This function provides first level TLB characteristics for 2M and 4M pages shared by each core on a compute unit.

| Bits  | Description  |
|-------|--|
| 31:24 | <b>L1DTlb2and4MAssoc: data TLB associativity for 2 MB and 4 MB pages.</b> Value: FFh. See: <a href="#">CPUID Fn8000_0005_ECX</a> [L1DcAssoc].  |
| 23:16 | <b>L1DTlb2and4MSize: data TLB number of entries for 2 MB and 4 MB pages.</b> Value: 32. The value returned is for the number of entries available for the 2 MB page size; 4 MB pages require two 2 MB entries, so the number of entries available for the 4 MB page size is one-half the returned value. |

|      |   |
|------|---|
| 15:8 | <b>L1ITlb2and4MAssoc:</b> instruction TLB associativity for 2 MB and 4 MB pages. Value: FFh. See: <a href="#">CPUID Fn8000_0005_ECX</a> [L1DcAssoc].  |
| 7:0  | <b>L1ITlb2and4MSize:</b> instruction TLB number of entries for 2 MB and 4 MB pages. Value: 24. The value returned is for the number of entries available for the 2 MB page size; 4 MB pages require two 2 MB entries, so the number of entries available for the 4 MB page size is one-half the returned value. |

### CPUID Fn8000\_0005\_EBX L1 TLB 4K Identifiers

This function provides first level TLB characteristics for 4K pages shared by each core on a compute unit.

| Bits  | Description   |
|-------|---|
| 31:24 | <b>L1DTlb4KAssoc:</b> data TLB associativity for 4 KB pages. Value: FFh. See: <a href="#">CPUID Fn8000_0005_ECX</a> [L1DcAssoc].        |
| 23:16 | <b>L1DTlb4KSize:</b> data TLB number of entries for 4 KB pages. Value: 32.  |
| 15:8  | <b>L1ITlb4KAssoc:</b> instruction TLB associativity for 4 KB pages. Value: FFh. See: <a href="#">CPUID Fn8000_0005_ECX</a> [L1DcAssoc]. |
| 7:0   | <b>L1ITlb4KSize:</b> instruction TLB number of entries for 4 KB pages. Value: 48.   |

### CPUID Fn8000\_0005\_ECX L1 Data Cache Identifiers

This function provides first level cache characteristics for each core.

| Bits    | Description   |      |             |     |          |     |                       |     |       |     |       |         |                 |     |                   |
|---------|---|------|-------------|-----|----------|-----|-----------------------|-----|-------|-----|-------|---------|-----------------|-----|-------------------|

### CPUID Fn8000\_0005\_EDX L1 Instruction Cache Identifiers

This function provides first level cache characteristics shared by both cores of a compute unit.

| Bits  | Description   |
|-------|---|
| 31:24 | <b>L1IcSize:</b> L1 instruction cache size KB. Value: 64.   |
| 23:16 | <b>L1IcAssoc:</b> L1 instruction cache associativity. Value: 2. See: <a href="#">CPUID Fn8000_0005_ECX</a> [L1DcAssoc]. |
| 15:8  | <b>L1IcLinesPerTag:</b> L1 instruction cache lines per tag. Value: 1.   |
| 7:0   | <b>L1IcLineSize:</b> L1 instruction cache line size in bytes. Value: 64.  |

**CPUID Fn8000\_0006\_EAX L2 TLB 2M/4M Identifiers**

This function provides second level TLB characteristics for 4K pages shared by each core on a compute unit.

| Bits  | Description  |
|-------|--|
| 31:28 | <b>L2DTlb2and4MAssoc: L2 data TLB associativity for 2 MB and 4 MB pages.</b> Value: 6. See: <a href="#">CPUID Fn8000_0006_ECX[L2Assoc]</a> .   |
| 27:16 | <b>L2DTlb2and4MSize: L2 data TLB number of entries for 2 MB and 4 MB pages.</b> Value: 1024. The value returned is for the number of entries available for the 2 MB page size; 4 MB pages require two 2 MB entries, so the number of entries available for the 4 MB page size is one-half the returned value.        |
| 15:12 | <b>L2ITlb2and4MAssoc: L2 instruction TLB associativity for 2 MB and 4 MB pages.</b> Value: 6. See: <a href="#">CPUID Fn8000_0006_ECX[L2Assoc]</a> .  |
| 11:0  | <b>L2ITlb2and4MSize: L2 instruction TLB number of entries for 2 MB and 4 MB pages.</b> Value: 1024. The value returned is for the number of entries available for the 2 MB page size; 4 MB pages require two 2 MB entries, so the number of entries available for the 4 MB page size is one-half the returned value. |

**CPUID Fn8000\_0006\_EBX L2 TLB 4K Identifiers**

This function provides second level TLB characteristics for 4K pages shared by each core on a compute unit.

| Bits  | Description  |
|-------|--|
| 31:28 | <b>L2DTlb4KAssoc: L2 data TLB associativity for 4 KB pages.</b> Value: 6. See: <a href="#">CPUID Fn8000_0006_ECX[L2Assoc]</a> .        |
| 27:16 | <b>L2DTlb4KSize: L2 data TLB number of entries for 4 KB pages.</b> Value: 1024.  |
| 15:12 | <b>L2ITlb4KAssoc: L2 instruction TLB associativity for 4 KB pages.</b> Value: 4. See: <a href="#">CPUID Fn8000_0006_ECX[L2Assoc]</a> . |
| 11:0  | <b>L2ITlb4KSize: L2 instruction TLB number of entries for 4 KB pages.</b> Value: 512.  |

**CPUID Fn8000\_0006\_ECX L2 Cache Identifiers**

This function provides second level cache characteristics shared by both cores of a compute unit.

### CPUID Fn8000\_0007\_EDX Advanced Power Management Information

This function provides advanced power management feature identifiers.

| Bits  | Description  |
|-------|--|
| 31:11 | Reserved.  |
| 10    | Reserved.  |
| 9     | <b>CPB: core performance boost.</b> Value: Product-specific. 1= Indicates presence of <a href="#">MSRC001_0015</a> [CpbDis] and support for core performance boost. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> . |
| 8     | <b>TscInvariant: TSC invariant.</b> Value: 1. The TSC rate is invariant.   |
| 7     | <b>HwPstate: hardware P-state control.</b> Value: 1. <a href="#">MSRC001_0061</a> [P-state Current Limit], <a href="#">MSRC001_0062</a> [P-state Control] and <a href="#">MSRC001_0063</a> [P-state Status] exist.                       |
| 6     | <b>100MHzSteps: 100 MHz multiplier Control.</b> Value: 1.  |
| 5     | Reserved.  |
| 4     | <b>TM: hardware thermal control (HTC).</b> Value: Product-specific.  |
| 3     | <b>TTP: THERMTRIP.</b> Value: 1.   |
| 2     | <b>VID: Voltage ID control.</b> Value: 0. Function replaced by HwPstate.   |
| 1     | <b>FID: Frequency ID control.</b> Value: 0. Function replaced by HwPstate.   |
| 0     | <b>TS: Temperature sensor.</b> Value: 1.   |

### CPUID Fn8000\_0008\_EAX Long Mode Address Size Identifiers

This provides information about the maximum physical and linear address width supported by the processor.

| Bits  | Description  |
|-------|--|
| 31:24 | Reserved.  |
| 23:16 | <b>GuestPhysAddrSize: maximum guest physical byte address size in bits.</b> Value: 0. 0=The maximum guest physical address size defined by PhysAddrSize. |
| 15:8  | <b>LinAddrSize: Maximum linear byte address size in bits.</b> Value: IF ( <a href="#">CPUID Fn8000_0001_EDX</a> [LM]) THEN 30h ELSE 20h ENDIF.           |
| 7:0   | <b>PhysAddrSize: Maximum physical byte address size in bits.</b> Value: 30h.   |

### CPUID Fn8000\_0008\_EBX Reserved

| Bits | Description |
|------|-------------|
| 31:0 | Reserved.   |

### CPUID Fn8000\_0008\_ECX APIC ID Size and Core Count

This provides information about the number of cores supported by the processor.

| Bits  | Description   |
|-------|---|
| 31:16 | Reserved.   |
| 15:12 | <b>ApicIdCoreIdSize: APIC ID size.</b> Value: IF (D18F3xE8[MultiNodeCpu]) THEN 5h ELSE 4h ENDIF. The number of bits in the initial APIC20[ApicId] value that indicate core ID within a processor.   |
| 11:8  | Reserved.   |
| 7:0   | <b>NC: number of physical cores - 1.</b> The number of cores in the processor is NC+1. E.g. If NC==0, then there is one core. This value is affected by D18F3x190[DisCore]. See 2.4.3 [Processor Cores and Downcoring] and D18F3x190[DisCore]. Value: Product-specific. |

### CPUID Fn8000\_001E\_EDX Reserved

See [CPUID Fn8000\\_001E\\_EAX](#).

| Bits | Description |
|------|-------------|
| 31:0 | Reserved.   |

### 3.11 MSRs - MSR0000\_xxxx

See [3.1 \[Register Descriptions and Mnemonics\]](#) for a description of the register naming convention. MSRs are accessed through x86 WRMSR and RDMSR instructions.

#### MSR0000\_0000 Load-Store MCA Address

| Bits | Description                             |
|------|---|
| 63:0 | Alias of <a href="#">MSR0000_0402</a> . |

#### MSR0000\_0001 Load-Store MCA Status

Unlike [MSR0000\\_0401](#), the access type of fields of [MSR0000\\_0001](#) are not affected by [MSRC001\\_0015\[McStatusWrEn\]](#); [MSR0000\\_0401](#) is always writable.

| Bits | Description                             |
|------|---|
| 63:0 | Alias of <a href="#">MSR0000_0401</a> . |

#### MSR0000\_0010 Time Stamp Counter (TSC)

Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:32 | <b>TSC[63:32]: time stamp counter high.</b> See: TSC[31:0].   |
| 31:0  | <b>TSC[31:0]: time stamp counter low.</b> Read-write; <a href="#">Updated-by-hardware</a> . TSC[63:0] = {TSC[63:32], TSC[31:0]}. The TSC increments at the P0 frequency. This field uses software P-state numbering. See <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . The TSC counts at the same rate in all P-states, all C states, S0, or S1. A read of this MSR in guest mode is affected by <a href="#">MSRC000_0104 [Time Stamp Counter Ratio (TscRateMsr)]</a> . The value (TSC/TSCRatio) is the TSC P0 frequency based value (as if TSCRatio==1.0) when (TSCRatio!=1.0). |

**MSR0000\_001B APIC Base Address (APIC\_BAR)**

| Bits  | Description  |      |             |     |                         |     |                                      |     |          |     |                                       |
|-------|--|------|-------------|-----|-------------------------|-----|--------------------------------------|-----|----------|-----|---------------------------------------|
| 63:48 | MBZ.   |      |             |     |                         |     |                                      |     |          |     |                                       |
| 47:12 | <b>ApicBar[47:12]: APIC base address register.</b> Read-write. Reset: 0000FEE00h. Specifies the base address, physical address [47:12], for the APICXX register set in xAPIC mode. See <a href="#">2.4.8.1.2 [APIC Register Space]</a> .   |      |             |     |                         |     |                                      |     |          |     |                                       |
| 11    | <b>ApicEn: APIC enable.</b> Read-write. Reset: 0. ApicEn[1:0] = {Apicx2En, ApicEn}. See <a href="#">2.4.8.1.2 [APIC Register Space]</a> . <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>00b</td><td>Local APIC is disabled.</td></tr> <tr> <td>01b</td><td>Local APIC is enabled in xAPIC mode.</td></tr> <tr> <td>10b</td><td>Reserved</td></tr> <tr> <td>11b</td><td>Local APIC is enabled in x2APIC mode.</td></tr> </table> | Bits | Description | 00b | Local APIC is disabled. | 01b | Local APIC is enabled in xAPIC mode. | 10b | Reserved | 11b | Local APIC is enabled in x2APIC mode. |
| Bits  | Description  |      |             |     |                         |     |                                      |     |          |     |                                       |
| 00b   | Local APIC is disabled.  |      |             |     |                         |     |                                      |     |          |     |                                       |
| 01b   | Local APIC is enabled in xAPIC mode.   |      |             |     |                         |     |                                      |     |          |     |                                       |

**MSR0000\_002A Cluster ID (EBL\_CR\_POWERON)**

Read; GP-write. Writes to this register result in a GP faults with error code 0.

| Bits  | Description   |
|-------|---|
| 63:18 | MBZ.  |
| 17:16 | <b>ClusterID.</b> Reset: 00b. The field does not affect hardware. |
| 15:0  | MBZ.  |

**MSR0000\_00E7 Max Performance Frequency Clock Count (MPERF)**

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>MPERF: maximum core clocks counter.</b> Read-write; <a href="#">Updated-by-hardware</a> . Incremented by hardware at the P0 frequency while the core is in C0. This register does not increment when the core is in the stop-grant state. In combination with <a href="#">MSR0000_00E8</a> , this register is used by software to determine the effective frequency of the core. A read of this MSR in guest mode is affected by <a href="#">MSR0000_0104 [Time Stamp Counter Ratio (TscRateMsr)]</a> . This field uses software P-state numbering. See <a href="#">MSR0001_0015 [EffFreqCntMwait]</a> , <a href="#">2.5.6 [Effective Frequency Interface]</a> , and <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . |

**MSR0000\_00E8 Actual Performance Frequency Clock Count (APERF)**

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>APERF: actual core clocks counter.</b> Read-write; <a href="#">Updated-by-hardware</a> . This register increments in proportion to the actual number of core clocks cycles while the core is in C0. The register does not increment when the core is in the stop-grant state. See <a href="#">MSR0000_00E7</a> . |

#### **MSR0000\_00FE MTRR Capabilities (MTRRcap)**

Read; GP-write. Reset: 0000\_0000\_0000\_0508h.

| Bits  | Description   |
|-------|---|
| 63:11 | Reserved.   |
| 10    | <b>MtrrCapWc: write-combining memory type.</b> 1=The write combining memory type is supported.        |
| 9     | Reserved.   |
| 8     | <b>MtrrCapFix: fixed range register.</b> 1=Fixed MTRRs are supported.                                 |
| 7:0   | <b>MtrrCapVCnt: variable range registers count.</b> Specifies the number of variable MTRRs supported. |

#### **MSR0000\_0174 SYSENTER CS (SYSENTER\_CS)**

| Bits  | Description   |
|-------|---|
| 63:32 | RAZ.  |
| 31:16 | Reserved.   |
| 15:0  | <b>SysEnterCS: SYSENTER target CS.</b> Read-write. Reset: 0000h. Holds the called procedure code segment. |

#### **MSR0000\_0175 SYSENTER ESP (SYSENTER\_ESP)**

Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:32 | Reserved.   |
| 31:0  | <b>SysEnterESP: SYSENTER target SP.</b> Read-write. Holds the called procedure stack pointer. |

#### **MSR0000\_0176 SYSENTER EIP (SYSENTER\_EIP)**

Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:32 | Reserved.   |
| 31:0  | <b>SysEnterEIP: SYSENTER target IP.</b> Read-write. Holds the called procedure instruction pointer. |

#### **MSR0000\_0179 Global Machine Check Capabilities (MCG\_CAP)**

Read; GP-write.

| Bits | Description  |
|------|--|
| 63:9 | Reserved.  |
| 8    | <b>McgCtlP: MCG_CTL register present.</b> Value: 1. 1=The machine check control registers (MCI_CTL) are present. See 2.13.1 [Machine Check Architecture] |
| 7:0  | <b>Count.</b> Value: 07h. Indicates the number of error reporting banks visible to each core.  |

### MSR0000\_017A Global Machine Check Status (MCG\_STAT)

Reset: 0000\_0000\_0000\_0000h. See 2.13.1 [Machine Check Architecture].

| Bits | Description  |
|------|--|
| 63:3 | Reserved.  |
| 2    | <b>MCIP: machine check in progress.</b> Read-write; set-by-hardware. 1=A machine check is in progress.   |
| 1    | <b>EIPV: error instruction pointer valid.</b> Read-write; Updated-by-hardware. 1=The instruction pointer that was pushed onto the stack by the machine check mechanism references the instruction that caused the machine check error.   |
| 0    | <b>RIPV: restart instruction pointer valid.</b> Read-write; Updated-by-hardware. 1=Program execution can be reliably restarted at the EIP address on the stack. 0=The interrupt was not precise and/or the process (task) context may be corrupt; continued operation of this process may not be possible without intervention, however system processing or other processes may be able to continue with appropriate software clean up. |

### MSR0000\_017B Global Machine Check Exception Reporting Control (MCG\_CTL)

Reset: 0000\_0000\_0000\_0000h. This registers controls enablement of the individual error reporting banks; see 2.13.1 [Machine Check Architecture]. When a machine check register bank is not enabled in MCG\_CTL, errors for that bank are not logged or reported, and actions enabled through the MCA are not taken; each MCI\_CTL register identifies which errors are still corrected when MCG\_CTL[i] is disabled.

| Bits | Description  |
|------|--|
| 63:7 | Unused.  |
| 6    | <b>MC6En: MC6 register bank enable.</b> Read-write. 1=The FP machine check register bank is enabled.                           |
| 5    | <b>MC5En: MC5 register bank enable.</b> Read-write. 1=The EX machine check register bank is enabled.                           |
| 4    | <b>MC4En: MC4 register bank enable.</b> Read-write. 1=The NB machine check register bank is enabled for all cores of the node. |
| 3    | Unused.  |
| 2    | <b>MC2En: MC2 register bank enable.</b> Read-write. 1=The CU machine check register bank is enabled.                           |
| 1    | <b>MC1En: MC1 register bank enable.</b> Read-write. 1=The IF machine check register bank is enabled.                           |
| 0    | <b>MC0En: MC0 register bank enable.</b> Read-write. 1=The LS machine check register bank is enabled.                           |

### MSR0000\_01D9 Debug Control (DBG\_CTL\_MSR)

| Bits | Description |
|------|-------------|
| 63:7 | Reserved.   |

|     |   |
|-----|---|
| 6   | MBZ.  |
| 5:2 | <b>PB: performance monitor pin control.</b> Read-write. Reset: 0. This field does not control any hardware. |
| 1   | <b>BTF.</b> Read-write. Reset: 0. 1=Enable branch single step.  |
| 0   | <b>LBR.</b> Read-write. Reset: 0. 1=Enable last branch record.  |

#### MSR0000\_01DB Last Branch From IP (BR\_FROM)

Read; GP-write; [Not-same-for-all](#); [Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>LastBranchFromIP.</b> Loaded with the segment offset of the branch instruction. |

#### MSR0000\_01DC Last Branch To IP (BR\_TO)

Read; GP-write; [Not-same-for-all](#); [Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>LastBranchToIP.</b> Holds the target RIP of the last branch that occurred before an exception or interrupt. |

#### MSR0000\_01DD Last Exception From IP

Read; GP-write; [Not-same-for-all](#); [Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>LastIntFromIP.</b> Holds the source RIP of the last branch that occurred before the exception or interrupt. |

#### MSR0000\_01DE Last Exception To IP

Read; GP-write; [Not-same-for-all](#); [Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>LastIntToIP.</b> Holds the target RIP of the last branch that occurred before the exception or interrupt. |

#### MSR0000\_020[F:0] Variable-Size MTRRs Base/Mask

Each MTRR ([MSR0000\\_020\[F:0\] \[Variable-Size MTRRs Base/Mask\]](#), [MSR0000\\_02\[6F:68,59:58,50\]](#), or [MSR0000\\_02FF \[MTRR Default Memory Type \(MTRRdefType\)\]](#)) specifies a physical address range and a corresponding memory type (MemType) associated with that range. Setting the memory type to an unsupported value results in a #GP.

The variable-size MTRRs come in pairs of base and mask registers ([MSR0000\\_0200](#) and [MSR0000\\_0201](#) are the first pair, etc.). Variables MTRRs are enabled through [MSR0000\\_02FF \[MTRR Default Memory Type \(MTRRdefType\)\]](#)[MtrrDefTypeEn]. A core access--with address CPUAddr--is determined to be within the address range of a variable-size MTRR if the following equation is true:  

$$\text{CPUAddr}[47:12] \& \text{PhyMask}[47:12] == \text{PhyBase}[47:12] \& \text{PhyMask}[47:12].$$

For example, if the variable MTRR spans 256 KB and starts at the 1 MB address. The PhyBase would be set to 0\_0010\_0000h and the PhyMask to F\_FFFC\_0000h (with zeros filling in for bits[11:0]). This results in a range from 0\_0010\_0000h to 0\_0013\_FFFF.

### MSR0000\_020[E,C,A,8,6,4,2,0] Variable-Size MTRRs Base

SharedC.

Table 259: Register Mapping for MSR0000\_020[E,C,A,8,6,4,2,0]

| Register     | Function |
|--------------|----------|
| MSR0000_0200 | Range 0  |
| MSR0000_0202 | Range 1  |
| MSR0000_0204 | Range 2  |
| MSR0000_0206 | Range 3  |
| MSR0000_0208 | Range 4  |

| Bits  | Description  |
|-------|--|
| 63:48 | MBZ.   |
| 47:12 | <b>PhyMask: address mask.</b> Read-write. Reset: 0.                                  |
| 11    | <b>Valid: valid.</b> Read-write. Reset: 0. 1=The variable-size MTRR pair is enabled. |
| 10:0  | MBZ.   |

**MSR0000\_02[6F:68,59:58,50] Fixed-Size MTRRs**

**SharedC.** See [MSR0000\\_020\[F:0\]](#) for general MTRR information. Fixed MTRRs are enabled through [MSR0000\\_02FF](#)[MtrrDefTypeFixEn and MtrrDefTypeEn].

For addresses below 1MB, the appropriate Fixed MTRRs override the default access destination. Each fixed MTRR includes two bits, RdDram and WrDram, that determine the destination based on the access type.

See [2.4.5.1.2 \[Determining The Access Destination for Core Accesses\]](#).

Table 262: Register Mapping for MSR0000\_02[6F:68,59:58,50]

| Register     | Function    |
|--------------|-------------|
| MSR0000_0250 | 64K Range   |

### MSR0000\_0277 Page Attribute Table (PAT)

This register specifies the memory type based on the PAT, PCD, and PWT bits in the virtual address page tables.

| Bits        | Description   |             |  |             |                    |    |                    |    |                      |    |                        |    |                      |    |      |    |                   |    |      |    |  |

### MSR0000\_02FF MTRR Default Memory Type (MTRRdefType)

SharedC. See [MSR0000\\_020\[F:0\]](#) for general MTRR information.

| Bits  | Description |
|-------|-------------|
| 63:12 | MBZ.        |

|     |   |
|-----|---|
| 11  | <b>MtrrDefTypeEn: variable and fixed MTRR enable.</b> Read-write. Reset: 0. 1= <a href="#">MSR0000_020[F:0]</a> [ <a href="#">Variable-Size MTRRs Base/Mask</a> ], and <a href="#">MSR0000_02[6F:68,59:58,50]</a> [ <a href="#">Fixed-Size MTRRs</a> ] are enabled. 0=Fixed and variable MTRRs are not enabled.   |
| 10  | <b>MtrrDefTypeFixEn: fixed MTRR enable.</b> Read-write. Reset: 0. 1= <a href="#">MSR0000_02[6F:68,59:58,50]</a> [ <a href="#">Fixed-Size MTRRs</a> ] are enabled. This field is ignored (and the fixed MTRRs are not enabled) if <a href="#">MSR0000_02FF[MtrrDefTypeEn]</a> =0.  |
| 9:8 | MBZ.  |
| 7:0 | <b>MemType: memory type.</b> Read-write. Reset: 0. If <a href="#">MtrrDefTypeEn</a> ==1 then MemType specifies the memory type for memory space that is not specified by either the fixed or variable range MTRRs. If <a href="#">MtrrDefTypeEn</a> ==0 then the default memory type for all of memory is UC. Valid encodings are {00000b, <a href="#">MSR0000_02[6F:68,59:58,50][2:0]</a> }. |

### MSR0000\_0400 LS Machine Check Control (MC0\_CTL)

Read-write. Reset: 0000\_0000\_0000\_0000h. BIOS: FFFF\_FFFF\_FFFF\_FFFFh. BIOS writes MC0\_CTL to work around some operating systems that skip MC0\_CTL during MCA initialization. See [2.13.1 \[Machine Check Architecture\]](#). See [MSRC001\\_0044 \[LS Machine Check Control Mask \(MC0\\_CTL\\_MASK\)\]](#).

| Bits  | Description   |
|-------|---|
| 63:10 | Unused.   |
| 9     | <b>IntErrType1: internal error type 1.</b>                            |
| 8     | <b>IntErrType2: internal error type 2.</b>                            |
| 7     | <b>SRDE: read data errors.</b> System read data errors on cache fill. |
| 6     | <b>LineFillPoison: line fill poison error.</b>                        |
| 5     | <b>SCBP: SCB parity.</b>  |
| 4     | <b>SQP: store queue parity.</b>                                       |
| 3     | <b>LQP: load queue parity.</b>  |
| 2     | <b>DatP: data parity.</b>   |
| 1     | <b>TLBP: TLB parity.</b>  |
| 0     | <b>TagP: tag parity error.</b>  |

### MSR0000\_0401 LS Machine Check Status (MC0\_STATUS)

Cold reset: 0. See [2.13.1 \[Machine Check Architecture\]](#). See [MSRC001\\_0015\[McStatusWrEn\]](#). [Table 264](#) describes each error type. [Table 265](#) describes the error codes and status register settings for each error type. [MSR0000\\_0001](#) is an alias of [MSR0000\\_0401](#).

| Bits | Description   |
|------|---|
| 63   | <b>Val: valid.</b> Read-write; Set-by-hardware. 1=A valid error has been detected (whether it is enabled or not). This bit should be cleared to 0 by software after the register has been read. |

| 62          | <p><b>Overflow: error overflow.</b> Read-write; Set-by-hardware. 1=An error was detected while the valid bit (Val) was set; at least one error was not logged. Overflow is set independently of whether the existing error is overwritten.</p> <p>The following hierarchy identifies the error logging priorities.</p> <ol style="list-style-type: none"> <li>1. Uncorrectable errors</li> <li>2. Deferred errors</li> <li>3. Correctable errors</li> </ol> <p>The machine check mechanism handles the contents of MCi_STATUS during overflow as follows:</p> <ul style="list-style-type: none"> <li>• Higher priority errors overwrite lower priority errors.</li> <li>• New errors of equal or lower priority do not overwrite existing errors.</li> <li>• Uncorrectable errors which are not logged due to overflow result in setting PCC, unless the new uncorrectable error is of the same type and in the same reportable address range as the existing error.</li> </ul> |             |                    |    |       |    |       |    |       |    |       |       |          |

**Table 264: LS Error Descriptions**

| Error Type             | Error Sub-type  | Description <sup>1</sup>   | CTL <sup>2</sup> | EAC <sup>3</sup> |
|------------------------|-----------------|--|------------------|------------------|
| Line Fill Error        | -               | An uncorrectable error occurred during a line fill from the L2 cache or the NB. (Note: For IO read, may not actually install to L1 cache.) | LineFill-Poison  | E                |
| Data Cache Error       | Data array      | Error occurred in cache data array access.   | DatP             | D                |
|                        | SCB             | Error occurred in SCB access.  | SCBP             | D                |
|                        | STQ             | Error occurred in STQ access.  | SQP              | D                |
| Tag Error              | Tag array       | A tag error was encountered. If uncorrectable, this errors is system fatal and results in a sync flood.                                    | TagP             | D                |
|                        | STQ             | Error occurred in STQ access.  | SQP              | D                |
|                        | LDQ             | Error occurred in LDQ access.  | LQP              | D                |
| L1 TLB Error           | TLB parity      | Parity error in L1 TLB access.   | TLBP             | D                |
|                        | TLB multi-match | Lookup hit on multiple entries.  |                  | D                |
|                        | Locked TLB miss | TLB miss occurred after lock granted.  |                  | E                |
| System Read Data Error | -               | An error occurred during an attempted read of data from the NB. Possible reasons include master abort, target abort.                       | SRDE             | E                |
| Internal Error         | IntErrType1     | A condition was detected which prohibits the core from continuing execution.   | IntErrType1      | E                |
|                        | IntErrType2     |  | IntErrType2      | E                |

1. CID: core ID. All LS errors are reported to the affected core; see [2.13.1.3](#).

2. See [MSR0000\\_0400](#).

3. EAC: D=Error action taken if detected. E=Error action taken if MCA bank enabled. See [2.13.1.3](#).

**MSR0000\_0402 LS Machine Check Address (MC0\_ADDR)**

Read-write; updated-by-hardware. Cold reset: 0. The MCi\_ADDR register contains valid data if indicated by MCi\_STATUS[AddrV]. See 2.13.1 [Machine Check Architecture]. MSR0000\_0000 is an alias of MSR0000\_0402.

| Bits | Description                          |
|------|--------------------------------------|
| 63:0 | <b>ADDR:</b> Address. See Table 266. |

**Table 266: LS Address Register**

| Error Type             | Error Sub-type | Address Register Bits | Description            |
|------------------------|----------------|-----------------------|------------------------|
| System Read Data Error | -              | 47:6                  | Physical address[47:6] |
| Line Fill Error        | -              | 47:6                  | Physical address[47:6] |
| Data Cache Error       | Data array     | 47:4                  | Physical address[47:4] |
|                        | SCB            | 11:4                  | Physical address[11:4] |
|                        | STQ            | 4:0                   | Index                  |

**Table 266: LS Address Register**

| Error Type   | Error Sub-type  | Address Register Bits | Description  |
|--------------|-----------------|-----------------------|--|
| Tag Error    | Tag array       | 47:4                  | Physical address[47:4]<br>For Probe errors, [47:6] |

|              | LDQ             | 5:0                   | Index  |
| L1 TLB Error | TLB parity      | 47:12<br>4:0          | Linear address[47:12]<br>TLB index                 |
|              | Locked TLB miss | 47:12                 | Linear address[47:12]                              |

**MSR0000\_0403 LS Machine Check Miscellaneous (MC0\_MISC)**See [2.13.1.7 \[Error Thresholding\]](#).

| Bits  | Description  |
|-------|--|
| 63    | <b>Valid.</b> Read-write. Reset: 1. 1=A valid CntP field is present in this register.  |
| 62    | <b>CntP: counter present.</b> Read-write. Reset: 1. 1=A valid threshold counter is present.  |
| 61:52 | Reserved.  |
| 51    | <b>CntEn: counter enable.</b> Read-write. Reset: 0. 1=Count thresholding errors; see <a href="#">2.13.1.7 [Error Thresholding]</a> .   |
| 50:49 | Reserved.  |
| 48    | <b>Overflow: overflow.</b> Read-write; Set-by-hardware. Cold reset: 0. Set by hardware when ErrCnt transitions from FFEh to FFFh. When this field is set, ErrCnt no longer increments.   |
| 47:44 | Reserved.  |
| 43:32 | <b>ErrCnt: error counter.</b> Read-write; Updated-by-hardware. Cold reset: 0. This is written by software to set the starting value of the error counter. This is incremented by hardware when errors are logged. When this counter overflows, it stays at FFFh (no rollover). The threshold value, written by software, is (FFFh - the desired error count (the number of errors necessary in order for an interrupt to be taken)); the desired error count of 0 or a write value of FFFh is not supported. |
| 31:24 | <b>BlkPtr: Block pointer for additional MISC registers.</b> Read-only. Reset: 00h. 00h=Extended MISC MSR block is not valid.   |
| 23:0  | Reserved.  |

**MSR0000\_0404 IF Machine Check Control (MC1\_CTL)**

**SharedC;** Read-write. Reset: 0000\_0000\_0000\_0000h. See [2.13.1 \[Machine Check Architecture\]](#). See [MSRC001\\_0045 \[IF Machine Check Control Mask \(MC1\\_CTL\\_MASK\)\]](#).

| Bits  | Description                                 |
|-------|---|
| 63:24 | Unused.                                     |
| 23    | <b>IVP: IC valid bit parity error.</b>      |
| 22    | <b>L1TLBM: IC L1 TLB multi-match error.</b> |

**Table 267: IF Error Descriptions**

| Error Type      | Error Sub-type | Description   | CTL <sup>3</sup> | CID <sup>2</sup> | EAC <sup>1</sup> |
|-----------------|----------------|---|------------------|------------------|------------------|
| Line Fill Error | -              | An uncorrectable error occurred during a demand line fill from the L2 cache; a machine check occurs before the instruction retires. | LineFill-Poison  | A                | E                |

**Table 267: IF Error Descriptions**

| Error Type                   | Error Sub-type              | Description  | CTL <sup>3</sup> | CID <sup>2</sup> | EAC <sup>1</sup> |
|------------------------------|-----------------------------|--|------------------|------------------|------------------|
| Instruction cache read error | IC Data Load Parity         | A parity error occurred during load of data from the instruction cache. The data is discarded from the IC and can be refetched.  | IDP              | A                | D                |
|                              | IC valid bit                | Parity error for IC valid bit.   | IVP              | A                | D                |
|                              | Main tag                    | A main tag parity error occurred.  | IMTP             | A                | D                |
|                              | Prediction queue            | Parity error in prediction queue.  | PQP              | A                | E                |
|                              | PFB data/address            | PFB data/address had a parity error. A PFB valid bit error, PFB multimatch error, Line Fill Error, or ReadData Error may additionally cause a PFB data/address error.  | PFBP             | A                | E                |
|                              | PFB valid bit               | PFB valid bit had a parity error. This error may cause subsequent errors related to the entry, but the effect can be contained to the running process.   |                  | B                | E                |
|                              | PFB non-cacheable bit       | PFB non-cacheable bit had a parity error. This error may cause subsequent errors related to the entry, but the effect can be contained to the running process.   |                  | B                | E                |
|                              | PFB promotion address error | An address parity error was detected when promoting from the PFB to the IC.  |                  | B                | E                |
| Instruction cache read error | Branch status register      | A parity error was discovered in the branch status register. This error is uncorrectable, but the effect can be contained to the running process.  | BSRP             | A                | E                |
|                              | Microcode Patch Buffer      | Parity error in the microcode patch buffer. This error is uncorrectable. If a reset is not performed or the patch area is not reloaded, then it is recommended that the compute unit be removed from the running configuration by the operating system if possible. After a reset, BIST is used to determine whether there is a hard fault in the RAM. If a hard fault is not found, the error was likely a transient upset and the RAM is not broken. This error can also be caused by an error in the microcode patch region of the CC6 save area if ECC is not enabled. | DEPRP            | A                | E                |

**Table 267: IF Error Descriptions**

| Error Type                   | Error Sub-type             | Description   | CTL <sup>3</sup> | CID <sup>2</sup> | EAC <sup>1</sup> |
|------------------------------|----------------------------|---|------------------|------------------|------------------|
| Instruction cache read error | Decoder micro-op queue     | Parity error in decode unit. This error is correctable unless the operation is for a non-cacheable operand.                 | DEUQ             | A                | E                |
|                              | Decoder instruction buffer |   | DEIBP            | A                | E                |
|                              | Decoder pre-decode buffer  |   | DEPD             | A                | E                |
|                              | Decoder fetch address FIFO |   | DEFF             | A                | E                |
| Tag Probe                    | Probe tag error            | A tag error was encountered during probe or victimization.  | ISTP             | 0                | D                |
|                              | Probe tag valid bit        | Parity error for IC probe tag valid bit.  | IVP              | 0                | D                |
| L1 TLB                       | Parity                     | Parity error in L1 TLB.   | L1TP             | A                | D                |
|                              | Multimatch                 | Hit multiple entries in L1 TLB.   | L1TLBM           | A                | D                |
| L2 TLB                       | Parity                     | Parity error in L2 TLB.   | L2TP             | A                | D                |
|                              | Multimatch                 | Hit multiple entries in L2 TLB.   | L2TLBM           | A                | D                |
| System Read Data Error       | -                          | An error occurred during an attempted demand read of data from the NB. Possible reasons include master abort, target abort. | SRDE             | A                | E                |

1. EAC: D=Error action taken if detected. E=Error action taken if MCA bank enabled. See [2.13.1.3](#).
2. CID: core ID. A=Error reported to the affected core. 0=Error reported to core 0 of the compute unit. B=Error reported to both cores of the compute unit. See [2.13.1.3](#).
3. See [MSR0000\\_0404](#).

**Table 268: IF Error Signatures**

| Error Type                   | Error Sub-type              | Error-Code-Ext | Error Code |    |   |      |       |    | UC  | ADDRV | PCC | Deferred | Poison |

**Table 270: MBE, SBU, and SBC Definitions**

| Term       | Definition   |
|------------|--|
| <b>MBE</b> | Multi-bit ECC error, uncorrected.  |
| <b>SBU</b> | Single-bit ECC error, not-corrected. There are some implementation specific conditions when a single bit error is not correctable. |
| <b>SBC</b> | Single-bit ECC error is detected and correctable.  |

**Table 271: CU Error Descriptions**

| Error Type       | Error Sub-Type | Description  | CTL <sup>3</sup> | CID <sup>2</sup> | EAC <sup>1</sup> |
|------------------|----------------|--|------------------|------------------|------------------|
| System Read Data | L2Tlb          | An error occurred during an attempted read of data from the NB. Possible reasons include master abort, target abort, and receipt of read data error for TLB. Error Action <sup>4</sup> : None. | RdData           | A                | D                |
|                  | Prefetch       |  |                  |                  |                  |

**Table 271: CU Error Descriptions**

| Error Type           | Error Sub-Type | Description   | CTL <sup>3</sup> | CID <sup>2</sup> | EAC <sup>1</sup> |
|----------------------|----------------|---|------------------|------------------|------------------|
| L2 Cache (continued) | VbData         | VB data ECC or parity error.<br><u>SubCase</u> <u>Description</u><br>Par   Parity: Parity error indicated when CECC and UECC are both clear. Error Action <sup>4</sup> : Poison sent to NB.<br><br>MBE,SBU Error Action <sup>4</sup> : Poison sent to NB.<br>SBC   Single-bit ECC error, corrected: Error Action <sup>4</sup> : Corrected data sent to NB.  | VbData           | 0                | D                |
| Tag                  | L2TagMH        | Multiple hits on L2 tag. Error Action <sup>4</sup> : <a href="#">Sync flood</a> .   | L2TagMulti Hit   | 0                | D                |
|                      | L2Tag          | A correctable or uncorrectable ECC error was seen in the L2 tag. The L2TagMH error signature supercedes the L2Tag error signature if they both occur for the same L2 tag read.<br><u>SubCase</u> <u>Description</u><br>MBE, SBU Error Action <sup>4</sup> : <a href="#">Sync flood</a> .<br>SBC   Error Action <sup>4</sup> : Correct error in array and retry the operation.<br><br>Hard   A hard error was seen in the L2 tag. Error Action <sup>4</sup> : <a href="#">Sync flood</a> . | L2Tag            | 0                | D                |
|                      | XabAddr        | Transaction Address Buffer (XAB) parity error. This error is system fatal; memory coherence may have been affected. Error Action <sup>4</sup> : <a href="#">Sync flood</a> .  | XabAddr          | A                | D                |
|                      | PrbAddr        | Probe buffer address parity error. This error is system fatal; memory coherence may have been affected. Error Action <sup>4</sup> : <a href="#">Sync flood</a> .  | PrbAddr          | 0                | D                |

1. EAC: The error action is taken if detected for all CU errors. D=Error action taken if detected. E=Error action taken if MCA bank enabled. See 2.13.1.3.
2. CID: core ID. A=Error reported to the affected core. 0=Error reported to core 0 of the compute unit; see 2.13.1.3.
3. See MSR0000\_0408.
4. Error Action: [Sync flood](#)=Take sync flood if PCC=1. None=No action other than that specified by MCA.

| Bits | Description |
|------|-------------|
| 63:0 | Reserved.   |

### MSR0000\_0410 NB Machine Check Control (MC4\_CTL)

Read-write; **Per-node**; **Not-same-for-all**. Reset: 0000\_0000\_0000\_0000h. MSR0000\_0410[31:0] is an alias of D18F3x40. This register is also accessible through PCI configuration space; see D18F3x40 [MCA NB Control]. See D18F3x44 [MCA NB Configuration]. See 2.13.1 [Machine Check Architecture]. Reporting is also masked by MSRC001\_0048 [NB Machine Check Control Mask (MC4\_CTL\_MASK)]. Accessibility of this register by non-NBC cores is affected by D18F3x44[NbMcaToMstCpuEn].

| Bits  | Description   |     |             |     |        |     |        |     |        |     |        |
|-------|---|-----|-------------|-----|--------|-----|--------|-----|--------|-----|--------|

| 27    | <b>TblWlkDatErrEn: table walk data error enable.</b> 1=Enables MCA reporting of uncorrectable errors in returned data from a GART table walk.   |     |             |     |        |     |        |     |        |     |        |
| 26    | <b>NbArrayParEn: northbridge array parity error reporting enable.</b> 1=Enables reporting of parity errors in the NB arrays.  |     |             |     |        |     |        |     |        |     |        |
| 25    | <b>McaUsPwDatErrEn: MCA upstream data error enable.</b> 1=Enables MCA reporting of upstream posted writes in which the link error bits indicate a data error.   |     |             |     |        |     |        |     |        |     |        |
| 24    | <b>SyncPktEn[3]: link sync packet error reporting enable for link 3.</b> See: SyncPktEn[2:0].   |     |             |     |        |     |        |     |        |     |        |
| 23    | <b>CrcErrEn[3]: link CRC error reporting enable for link 3.</b> See: CrcErrEn[2:0].   |     |             |     |        |     |        |     |        |     |        |
| 22:19 | <b>RtryHtEn: link retry reporting enable.</b> 1=Enables MCA reporting of retries on the link.   |     |             |     |        |     |        |     |        |     |        |
|       | <table> <tr> <th>Bit</th><th>Description</th></tr> <tr> <td>[3]</td><td>Link 3</td></tr> <tr> <td>[2]</td><td>Link 2</td></tr> <tr> <td>[1]</td><td>Link 1</td></tr> <tr> <td>[0]</td><td>Link 0</td></tr> </table> | Bit | Description | [3] | Link 3 | [2] | Link 2 | [1] | Link 1 | [0] | Link 0 |
| Bit   | Description   |     |             |     |        |     |        |     |        |     |        |
| [3]   | Link 3  |     |             |     |        |     |        |     |        |     |        |
| [2]   | Link 2  |     |             |     |        |     |        |     |        |     |        |
| [1]   | Link 1  |     |             |     |        |     |        |     |        |     |        |
| [0]   | Link 0  |     |             |     |        |     |        |     |        |     |        |

| 18  | <b>DramParEn: DRAM parity error reporting enable.</b> 1=Enables MCA reporting of parity errors on the DRAM address or control signals.  |     |             |     |        |     |        |     |        |     |        |
|-----|---|-----|-------------|-----|--------|-----|--------|-----|--------|-----|--------|
| 17  | <b>HtDataEn: link data error reporting enable.</b> 1=Enables MCA reporting of packets with data errors detected on links.   |     |             |     |        |     |        |     |        |     |        |
| 16  | <b>ProtEn: protocol error reporting enable.</b> 1=Enables MCA reporting of protocol errors detected on links or in the L3 cache. When possible, this enable should be cleared before initiating a warm reset to avoid logging spurious errors due to RESET_L signal skew.   |     |             |     |        |     |        |     |        |     |        |
| 15  | <b>L3ArrayUCEn: L3 cache array uncorrectable error reporting enable.</b> 1=Enables MCA reporting of uncorrectable errors in the L3 cache arrays.  |     |             |     |        |     |        |     |        |     |        |
| 14  | <b>L3ArrayCorEn: L3 cache array correctable error reporting enable.</b> 1=Enables MCA reporting of correctable errors in the L3 cache arrays.   |     |             |     |        |     |        |     |        |     |        |
| 13  | Unused.   |     |             |     |        |     |        |     |        |     |        |
| 12  | <b>WDTRptEn: watchdog timer error reporting enable.</b> 1=Enables MCA reporting of watchdog timer errors. The watchdog timer checks for NB system accesses for which a response is expected but no response is received. See <a href="#">D18F3x44 [MCA NB Configuration]</a> for information regarding configuration of the watchdog timer duration. This bit does not affect operation of the watchdog timer in terms of its ability to complete an access that would otherwise cause a system hang. This bit only affects whether such errors are reported through MCA.           |     |             |     |        |     |        |     |        |     |        |
| 11  | <b>AtomicRMWEn: atomic read-modify-write error reporting enable.</b> 1=Enables MCA reporting of atomic read-modify-write (RMW) commands received from an IO link. Atomic RMW commands are not supported. An atomic RMW command results in a link error response being generated back to the requesting IO device. The generation of the link error response is not affected by this bit.  |     |             |     |        |     |        |     |        |     |        |
| 10  | <b>GartTblWkEn: GART table walk error reporting enable.</b> 1=Enables MCA reporting of GART cache table walks which encounter a GART PTE entry which is invalid.  |     |             |     |        |     |        |     |        |     |        |
| 9   | <b>TgtAbortEn: target abort error reporting enable.</b> 1=Enables MCA reporting of target aborts to a link. The NB returns an error response back to the requestor with any associated data all 1s independent of the state of this bit.  |     |             |     |        |     |        |     |        |     |        |
| 8   | <b>MstrAbortEn: master abort error reporting enable.</b> 1=Enables MCA reporting of master aborts to a link. The NB returns an error response back to the requestor with any associated data all 1s independent of the state of this bit.   |     |             |     |        |     |        |     |        |     |        |
| 7:5 | <p><b>SyncPktEn[2:0]: link sync packet error reporting enable for links [2:0].</b> SyncPktEn[3:0] = {SyncPktEn[3], SyncPktEn[2:0]}. 1=Enables MCA reporting of link-defined sync error packets detected on link. The NB floods its outgoing links with sync packets after detecting a sync packet on an incoming link independent of the state of this bit.</p> <table> <tr> <th>Bit</th><th>Description</th></tr> <tr> <td>[3]</td><td>Link 3</td></tr> <tr> <td>[2]</td><td>Link 2</td></tr> <tr> <td>[1]</td><td>Link 1</td></tr> <tr> <td>[0]</td><td>Link 0</td></tr> </table> | Bit | Description | [3] | Link 3 | [2] | Link 2 | [1] | Link 1 | [0] | Link 0 |
| Bit | Description   |     |             |     |        |     |        |     |        |     |        |
| [3] | Link 3  |     |             |     |        |     |        |     |        |     |        |
| [2] | Link 2  |     |             |     |        |     |        |     |        |     |        |
| [1] | Link 1  |     |             |     |        |     |        |     |        |     |        |
| [0] | Link 0  |     |             |     |        |     |        |     |        |     |        |

| 4:2 | <b>CrcErrEn[2:0]: link CRC error reporting enable for links [2:0].</b> CrcErrEn[3:0] = {CrcErrEn[3], CrcErrEn[2:0]}. 1=Enables MCA reporting of CRC errors detected on link (see the description of CRC Error in <a href="#">Table 274</a> ). The NB floods its outgoing links with sync packets after detecting a CRC error on an incoming link independent of the state of this bit.<br><table><tr><th>Bit</th><th>Description</th></tr><tr><td>[3]</td><td>Link 3</td></tr><tr><td>[2]</td><td>Link 2</td></tr><tr><td>[1]</td><td>Link 1</td></tr><tr><td>[0]</td><td>Link 0</td></tr></table> | Bit | Description | [3] | Link 3 | [2] | Link 2 | [1] | Link 1 | [0] | Link 0 |

| 1   | <b>UECCEn: uncorrectable ECC error reporting enable.</b> 1=Enables MCA reporting of DRAM uncorrectable ECC errors which are detected in the NB. In some cases data may be forwarded to the core prior to checking ECC in which case the check takes place in one of the other error reporting banks.   |     |             |     |        |     |        |     |        |     |        |
| 0   | <b>CECCEn: correctable ECC error reporting enable.</b> 1=Enables MCA reporting of DRAM correctable ECC errors which are detected in the NB.  |     |             |     |        |     |        |     |        |     |        |

### MSR0000\_0411 NB Machine Check Status (MC4\_STATUS)

Per-node; Not-same-for-all. Cold reset: x. See [2.13.1 \[Machine Check Architecture\]](#). See [MSRC001\\_0015\[McStatusWrEn\]](#). [Table 274](#) describes each error type. [Table 275](#) and [Table 276](#) describe the error codes and status register settings for each error type. [MSR0000\\_0411\[31:0\]](#) is an alias of [D18F3x48](#). [MSR0000\\_0411\[63:32\]](#) is an alias of [D18F3x4C](#). Accessibility of this register by non-NBC cores is affected by [D18F3x44\[NbMcaToMstCpuEn\]](#).

| Bits  | Description  |
|-------|--|
| 63    | <b>Val: valid.</b> Read-write; Set-by-hardware. See <a href="#">MSR0000_0401[Val]</a> .  |
| 62    | <b>Overflow: error overflow.</b> Read-write; Set-by-hardware. See <a href="#">MSR0000_0401[Overflow]</a> .   |
| 61    | <b>UC: error uncorrected.</b> Read-write; Updated-by-hardware. See <a href="#">MSR0000_0401[UC]</a> .  |
| 60    | <b>En: error enable.</b> Read-write; Updated-by-hardware. See <a href="#">MSR0000_0401[En]</a> .   |
| 59    | <b>MiscV: miscellaneous error register valid.</b> Read-write; Updated-by-hardware. See <a href="#">MSR0000_0401[MiscV]</a> . 1=Valid thresholding in <a href="#">MSR0000_0413</a> , <a href="#">MSRC000_0408</a> , or <a href="#">MSRC000_0409</a> .   |
| 58    | <b>AddrV: error address valid.</b> Read-write; Updated-by-hardware. See <a href="#">MSR0000_0401[AddrV]</a> .  |
| 57    | <b>PCC: processor context corrupt.</b> Read-write; Set-by-hardware. See <a href="#">MSR0000_0401[PCC]</a> .  |
| 56    | <b>ErrCoreIdVal: error core ID is valid.</b> Read-write; Set-by-hardware. 1=The ErrCoreId field is valid.  |
| 55    | Reserved.  |
| 54:47 | <b>Syndrome[7:0].</b> Read-write; Updated-by-hardware. Syndrome[15:0] = {Syndrome[15:8], Syndrome[7:0]}. The syndrome bits when an ECC error is detected. See <a href="#">Table 276</a> Valid Syndrome column for which bits are valid for each error. |
| 46    | <b>CECC: correctable ECC error.</b> Read-write; Updated-by-hardware. 1=The error was a correctable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.               |
| 45    | <b>UECC: uncorrectable ECC error.</b> Read-write; Updated-by-hardware. 1=The error was an uncorrectable ECC error according to the restrictions of the ECC algorithm. UC indicates whether the error was actually corrected by the processor.          |
| 44    | Reserved.  |

| 43:42 | <b>McaStatSubCache: L3 subcache in error.</b> Read-write; Updated-by-hardware. Indicates the number of the L3 subcache associated with the error. This field is only valid when an L3 error is recorded.  |     |             |     |        |     |        |     |        |     |        |     |             |       |          |     |       |     |       |
|-------|---|-----|-------------|-----|--------|-----|--------|-----|--------|-----|--------|-----|-------------|-------|----------|-----|-------|-----|-------|
| 41    | <b>SubLink: sublink or DRAM channel.</b> Read-write; Set-by-hardware. For errors associated with a link, this bit indicates if the error was associated with the upper or lower byte of the link. For DRAM parity errors, this bit indicates which channel the error was associated with. 0=DCT A; Sublink [7:0]. 1=DCT B; Sublink [15:8].  |     |             |     |        |     |        |     |        |     |        |     |             |       |          |     |       |     |       |
| 40    | <b>Scrub: error detected on a scrub.</b> Read-write; Set-by-hardware.   |     |             |     |        |     |        |     |        |     |        |     |             |       |          |     |       |     |       |
| 39:36 | <p><b>Link.</b> Read-write; Set-by-hardware.</p> <ul style="list-style-type: none"> <li>For errors associated with a link, this field indicates which link was associated with the error.</li> </ul> <table> <thead> <tr> <th>Bit</th><th>Description</th></tr> </thead> <tbody> <tr> <td>[3]</td><td>Link 3</td></tr> <tr> <td>[2]</td><td>Link 2</td></tr> <tr> <td>[1]</td><td>Link 1</td></tr> <tr> <td>[0]</td><td>Link 0</td></tr> </tbody> </table> <ul style="list-style-type: none"> <li>For L3 cache errors, this field indicates the L3 way in error, and McaStatSubCache contains sub-cache number.</li> <li>For DRAM parity errors, this field indicates which DCT detected an error.</li> </ul> <table> <thead> <tr> <th>Bit</th><th>Description</th></tr> </thead> <tbody> <tr> <td>[3:2]</td><td>Reserved</td></tr> <tr> <td>[1]</td><td>DCT 1</td></tr> <tr> <td>[0]</td><td>DCT 0</td></tr> </tbody> </table> | Bit | Description | [3] | Link 3 | [2] | Link 2 | [1] | Link 1 | [0] | Link 0 | Bit | Description | [3:2] | Reserved | [1] | DCT 1 | [0] | DCT 0 |

**Table 274: NB Error Descriptions**

| Error Type | Description   | CTL <sup>1</sup> | ETG <sup>2</sup> | EAC |
|------------|---|------------------|------------------|-----|
| CRC Error  | CRC error detected on link. If the link is in retry mode, this may indicate excessive link reconnect failures; see <a href="#">D18F0x[E4,C4,A4,84][CrcErr, LinkFail, CrcFloodEn]</a> . This error can also be seen as the result of link training failures.<br><br>The NB floods its outgoing links with sync packets after detecting a CRC error on an incoming link independent of the state of the control bits. | CrcErrEn         | L                | D   |
| Sync Error | Link-defined sync error packets detected on link. The NB floods its outgoing links with sync packets after detecting a sync packet on an incoming link independent of the state of the control bits.  | SyncPktEn        | L                | D   |

**Table 274: NB Error Descriptions**

| Error Type        | Description   | CTL <sup>1</sup>   | ETG <sup>2</sup> | EAC |
|-------------------|---|--|------------------|-----|
| Master Abort      | Master abort seen as result of link operation. Reasons for this error include requests to non-existent addresses, and requesting extended addresses while extended mode disabled (see <a href="#">D18F0x[E4,C4,A4,84][Addr64BitEn]</a> ). The NB returns an error response back to the requestor with any associated data all 1s independent of the state of the control bit.   | MstrAbortEn  | L                | D   |
| Target Abort      | Target abort seen as result of link operation. The NB returns an error response back to the requestor with any associated data all 1s independent of the state of the control bit.  | TgtAbortEn   | L                | D   |
| GART Error        | GART cache table walk encountered a GART PTE entry which was invalid.   | GartTblWkEn  | L                | D   |
| RMW Error         | An atomic read-modify-write (RMW) command was received from an IO link. Atomic RMW commands are not supported. An atomic RMW command results in a link error response being generated back to the requesting IO device. The generation of the link error response is not affected by the control bit.   | AtomicRM-WEn   | L                | D   |
| WDT Error         | NB WDT timeout due to lack of progress. The NB WDT monitors transaction completions. A transaction that exceeds the programmed time limit reports errors via the MCA. The cause of error may be another node or device which failed to respond.   | WDTRptEn   | L                | D   |
| ECC Error         | DRAM ECC error detected.  | CECCEn,<br>UECCEn  | D                | D   |
| Link Data Error   | Data error detected on link.<br>If enabled for reporting and the request is sourced from a core, then PCC is set. (If not enabled for reporting, PCC is not set. If configured to allow an error response to be returned to the core, this could allow error containment to a scope smaller than the entire system.)  | HtDataEn,<br>McaUsPwDat-ErrEn,<br><a href="#">D18F3x180[DeferDatErrNcHt-McaEn]</a> | L                | D   |
| Protocol Error    | Protocol error detected by link, L3, or probe filter. These errors are distinguished from each other by the value in <a href="#">MSR0000_0412[ErrAddr]</a> . See <a href="#">Table 278</a> .<br><br>For protocol errors, the system cannot continue operation. Protocol errors can be caused by other subcomponents than the one reporting the error. For diagnosis, collect and examine MCA registers from other banks, cores, and processors in the system.<br><br>For link protocol errors, ensure that the error is not due to failure or reset at the far end of link or from transmission corruption, indicated by CRC error. The enable for this error should be cleared before initiating a warm reset to avoid logging spurious errors due to RESET_L signal skew. | ProtEn   | L <sup>3</sup>   | D   |
| NB Array Error    | A parity error was detected in the NB internal arrays.  | NbArrayParEn   | -                | D   |
| DRAM Parity Error | A parity error was detected on the DRAM address or control signals.   | DramParEn  | D                | D   |

**Table 274: NB Error Descriptions**

| Error Type                 | Description   | CTL <sup>1</sup>             | ETG <sup>2</sup> | EAC |
|----------------------------|---|------------------------------|------------------|-----|
| Link Retry                 | A transmission error occurred on the link; the IO link Error Retry Protocol is executed. Retry may have been initiated by either end of the link.   | RtryHtEn                     | L                | D   |
| GART Table Walk Data Error | An uncorrectable error was found in data returned from a GART table walk.   | TblWlkDatErrEn               | L                | D   |
| L3 Cache Data Error        | ECC error detected in L3 cache data.  | L3ArrayCorEn,<br>L3ArrayUCEn | C                | D   |
| L3 Cache Tag Error         | Error detected in L3 cache tag. The subcache, index, and way are logged. See <a href="#">Table 276</a> footnotes.   |                              | C                | D   |
| L3 Cache LRU Error         | Error detected in LRU parity bits. This is a non-fatal error which has no impact on any program execution; LRU state is reset. The cache index is captured for thresholding purposes.   | -                            | C                | D   |
| Probe Filter Error         | An ECC error was detected in the probe filter directory. See <a href="#">2.9.4.1.1 [Probe Filter Errors]</a> .  | CECCEn                       | C                | D   |
| Compute Unit Data Error    | NB received a data error from a core and this error could not be contained. Sync flood will occur if <a href="#">D18F3x180[CpuLeakErrEn]</a> is set. For the cause of the data error, examine the core MCA registers for deferred errors. This error may occur for the following types of data writes: <ul style="list-style-type: none"> <li>• DRAM</li> <li>• APIC</li> <li>• Configuration space (IO and MMIO)</li> </ul> For these errors, sync flood will occur if <a href="#">D18F3x180[CpuLeakErrEn]</a> is set. | McaCpuDatErrEn               | -                | D   |

1. See [MSR0000\\_0410](#).

2. ETG: error threshold group. L=Link. D=DRAM. C=L3 Cache. See [2.13.1.7 \[Error Thresholding\]](#).

3. The error thresholding group is Link if link protocol error; none for non-link protocol error.

4. EAC: D=Error action taken if detected. E=Error action taken if MCA bank enabled. See [2.13.1.3](#).

The NB is capable of reporting the following errors:

**Table 275: NB Error Signatures, Part 1**

| Error Type | ErrorCode-Ext | Error Code |         |   |       |                     |    |

1. See [Table 282: \[NB Address Register for Watchdog Timer Errors\]](#)
2. See [Table 278 \[NB Address Register for Protocol Errors\]](#)
3. Link identified only if link protocol error. See entry in [Table 274](#).
4. See [Table 280: \[NB Address Register for NB Array Errors\]](#)
5. See [Table 281: \[NB Address Register for L3 Array Errors\]](#)
6. This field contains the L3 way in error. [D18F3x4C\[McaStatSubCache\]](#) contains the subcache number.
7. Depends on Memory Transaction Type ([Table 118](#)); valid if non-zero.
8. MS: multi-symbol. 1=Multi-symbol. 0=Not multi-symbol. See [2.13.2 \[DRAM Considerations for ECC\]](#) for information on symbol size.
9. Retries initiated by either side of the link are logged.
10. MB: multi-bit error. 1=Multi-bit error.
11. SB: single bit error. 1=Single bit error.
12. Core: source is core. 1=Source is core. 0=Source is not core.

**MSR0000\_0412 NB Machine Check Address (MC4\_ADDR)**

Read-write; **Per-node**; **Not-same-for-all**. Cold reset: x. See [2.13.1 \[Machine Check Architecture\]](#).

[MSR0000\\_0412\[31:0\]](#) is an alias of [D18F3x50](#). [MSR0000\\_0412\[63:32\]](#) is an alias of [D18F3x54](#).

[ErrAddr\[47:1\]](#) carries supplemental information associated with a machine check error, generally the address being accessed. Accessibility of this register by non-NBC cores is affected by [D18F3x44\[NbMcaToMst-CpuEn\]](#).

| Bits  | Description  |
|-------|--|
| 63:48 | Reserved.  |
| 47:32 | <b>ErrAddr[47:32]: Error Address Bits[47:32]</b> . See: <a href="#">ErrAddr[31:1]</a> .  |
| 31:1  | <b>ErrAddr[31:1]: Error Address Bits[31:1]</b> . <a href="#">ErrAddr[63:0]</a> = {00h, <a href="#">MSR0000_0412[ErrAddr[47:32]]</a> , <a href="#">MSR0000_0412[ErrAddr[31:1]]</a> ,0b}. See the tables below for the encoding. |
| 0     | Reserved.  |

The register format depends on the type of error being logged:

- Protocol errors contain the error reason code, may contain the physical address, and are formatted according

to [Table 278](#).

- NB array errors indicate the array in error, and are formatted according to [Table 280](#).
- L3 array errors store the physical address which caused the error, and are formatted according to [Table 281](#).
- NB Watchdog timer errors depend on the mode selected by [D18F3x180](#)[McaLogErrAddrWdtErr], and the format is indicated by [D18F3x4C](#)[AddrV]. If [D18F3x4C](#)[AddrV] is indicated, errors are formatted according to [Table 277](#). If [D18F3x4C](#)[AddrV] is not indicated, errors are formatted according to [Table 282](#).
- All other NB errors which indicate [D18F3x4C](#)[AddrV] are formatted according to [Table 277](#).

**Table 277: NB Address Register Default Encoding**

| ErrAddr | Description                 |
|---------|-----------------------------|
| 47:1    | Physical address bits 47:1. |

**Table 278: NB Address Register for Protocol Errors**

| ErrAddr | Description  |
|---------|--|
| 47:6    | If <a href="#">D18F3x4C</a> [AddrV] set, contains physical address bits 47:6, else reserved. |
| 5:1     | ProtocolErrorType. See <a href="#">Table 279</a> .   |

**Table 279: Protocol Error Type**

| Link Protocol Error Type | Description   |
|--------------------------|---|
| 00000b                   | Link: SRQ Read Response without matching request  |
| 00001b                   | Link: Probe Response without matching request   |
| 00010b                   | Link: TgtDone without matching request  |
| 00011b                   | Link: TgtStart without matching request   |
| 00100b                   | Link: Command buffer overflow   |
| 00101b                   | Link: Data buffer overflow  |
| 00110b                   | Link: Link retry packet count acknowledge overflow  |
| 00111b                   | Link: Data command in the middle of a data transfer   |
| 01000b                   | Link: Link address extension command followed by a packet other than a command with address.  |
| 01001b                   | Link: A specific coherent-only packet from a CPU was issued to an IO link.  |
| 01010b                   | Link: A command with invalid encoding was received. This error occurs when: <ol style="list-style-type: none"> <li>1. Any invalid command is received (including a command with no valid encoding or a coherent link command over an IO link or vice versa) while not in retry mode.</li> <li>2. Any illegal command is received in which the CRC is correct while in retry mode (including any upstream broadcast command (HT command encoding = 6'b11101x)).</li> </ol> |
| 01011b                   | Link: Link CTL deassertion occurred when a data phase was not pending. This error condition may only occur when error-retry mode is not enabled (if it is enabled, this condition triggers a retry).  |
| 011xxb                   | Reserved  |
| 10000b                   | L3: Request gets multiple hits in L3  |

**Table 282: NB Address Register for Watchdog Timer Errors**

| Bits  | Description   |
|-------|---|
| 14:11 | <b>SrqEntryState</b> . Records unspecified, implementation-specific information (all zeroes means idle).  |
| 10:7  | <b>OpType</b> . Records unspecified, implementation-specific information.   |
| 6:1   | <b>LinkCommand</b> . When the NB WDT expires, the link command of the transaction that timed out is captured here. This field is encoded identically to the “Code” field for link transactions defined in the link specification. |
| 0     | Reserved  |

**MSR0000\_0413 NB Machine Check Misc (DRAM Thresholding) 0 (MC4\_MISC0)**

Per-node; Not-same-for-all. [MSR0000\\_0413](#) is the first of the NB machine check miscellaneous registers. [MSR0000\\_0413](#) is associated with the DRAM error type. To see the remaining NB machine check miscellaneous registers, refer to [MSRC000\\_0408](#) and [MSRC000\\_0409](#). See [D18F3x44](#)[NbMcaToMstCpuEn]. [MSR0000\\_0413](#)[63:32] is an alias of [D18F3x160](#).

| Bits  | Description   |      |             |       |                                     |       |  |     |   |     |          |
|-------|---|------|-------------|-------|-------------------------------------|-------|--|-----|---|-----|----------|
| 63    | <b>Valid.</b> Read-write. Reset: 1. 1=The CntP field is present.  |      |             |       |                                     |       |  |     |   |     |          |
| 62    | <b>CntP: counter present.</b> Read-write. Reset: 1. 1=A valid threshold counter is present.   |      |             |       |                                     |       |  |     |   |     |          |
| 61    | <b>Locked.</b> Read-write. Reset: 0. BIOS: IF (IntType==10b) THEN 1 ELSE 0 ENDIF. 1=Writes to bits [55:32] of this register are ignored. Set by BIOS to indicate that this register is not available for OS use. When <a href="#">MSRC001_0015</a> [McStatusWrEn] is set, MSR writes to this register update all bits, regardless of the state of the Locked bit.   |      |             |       |                                     |       |  |     |   |     |          |

**MSR0000\_041A FP Machine Check Address (MC6\_ADDR)**

Reset: 0000\_0000\_0000\_0000h. Read-only. See 2.13.1 [Machine Check Architecture].

| Bits | Description |
|------|-------------|
| 63:0 | Reserved.   |

### MSR0000\_041B FP Machine Check Miscellaneous (MC6\_MISC)

Reset: 0000\_0000\_0000\_0000h. Read-only. See 2.13.1 [Machine Check Architecture].

| Bits | Description |
|------|-------------|
| 63:0 | Reserved.   |

## 3.12 MSRs - MSRC000\_0xxx

### MSRC000\_0080 Extended Feature Enable (EFER)

SKINIT Execution: 0000\_0000\_0000\_0000h.

| Bits  | Description  |
|-------|--|
| 63:16 | MBZ.   |
| 15    | MBZ.   |
| 14    | <b>FFXSE: fast FXSAVE/FRSTOR enable.</b> Read-write. Reset: 0. 1=Enables the fast FXSAVE/FRSTOR mechanism. Support for this field indicated by <a href="#">CPUID Fn0000_0001_EDX[FXSR]</a> . This bit is set once by the operating system and its value is not changed afterwards. |
| 13    | <b>LMSLE: long mode segment limit enable.</b> Read-write. Reset: 0. 1=Enables the long mode segment limit check mechanism.   |
| 12    | <b>SVME: secure virtual machine (SVM) enable.</b> IF ( <a href="#">MSRC001_0114</a> [SvmeDisable]==1) THEN MBZ. ELSE Read-write. ENDIF. Reset: 0. 1=SVM features are enabled.  |
| 11    | <b>NXE: no-execute page enable.</b> Read-write. Reset: 0. 1=The no-execute page protection feature is enabled. Support for this field indicated by <a href="#">CPUID Fn8000_0001_EDX[NX]</a> .   |
| 10    | <b>LMA: long mode active.</b> Read-only; <b>Not-same-for-all</b> . Reset: 0. 1=Indicates that long mode is active. Support for this field indicated by <a href="#">CPUID Fn8000_0001_EDX[LM]</a> .   |
| 9     | MBZ.   |
| 8     | <b>LME: long mode enable.</b> Read-write; <b>Not-same-for-all</b> . Reset: 0. 1=Long mode is enabled. Support for this field indicated by <a href="#">CPUID Fn8000_0001_EDX[LM]</a> .  |
| 7:1   | RAZ.   |
| 0     | <b>SYSCALL: system call extension enable.</b> Read-write. Reset: 0. 1=SYSCALL and SYSRET instructions are enabled. This adds the SYSCALL and SYSRET instructions which can be used in flat addressed operating systems as low latency system calls and returns.                    |

### MSRC000\_0081 SYSCALL Target Address (STAR)

Reset: 0000\_0000\_0000\_0000h. This register holds the target address used by the SYSCALL instruction and the code and stack segment selector bases used by the SYSCALL and SYSRET instructions.

| Bits  | Description  |
|-------|--|
| 63:48 | <b>SysRetSel: SYSRET CS and SS.</b> Read-write.    |
| 47:32 | <b>SysCallSel: SYSCALL CS and SS.</b> Read-write.  |
| 31:0  | <b>Target: SYSCALL target address.</b> Read-write. |

#### MSRC000\_0082 Long Mode SYSCALL Target Address (STAR64)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>LSTAR: long mode target address.</b> Read-write. Target address for 64-bit mode calling programs. The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs). |

#### MSRC000\_0083 Compatibility Mode SYSCALL Target Address (STARCOMPAT)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>CSTAR: compatibility mode target address.</b> Read-write. Target address for compatibility mode. The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs). |

#### MSRC000\_0084 SYSCALL Flag Mask (SYSCALL\_FLAG\_MASK)

| Bits  | Description  |
|-------|--|
| 63:32 | RAZ.   |
| 31:0  | <b>Mask: SYSCALL flag mask.</b> Read-write. Reset: 0000_0000h. This register holds the EFLAGS mask used by the SYSCALL instruction. 1=Clear the corresponding EFLAGS bit when executing the SYSCALL instruction. |

#### MSRC000\_0100 FS Base (FS\_BASE)

[Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>FSBase: expanded FS segment base.</b> Read-write. This register provides access to the expanded 64-bit FS segment base. The address stored in this register must be in canonical form (if not canonical, a #GP fault fill occurs). |

#### MSRC000\_0101 GS Base (GS\_BASE)

[Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>GSBase: expanded GS segment base.</b> Read-write. This register provides access to the expanded 64-bit GS segment base. The address stored in this register must be in canonical form (if not canonical, a #GP fault fill occurs). |

**MSRC000\_0102 Kernel GS Base (KernelGSbase)**

[Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>KernelGSBase: kernel data structure pointer.</b> Read-write. This register holds the kernel data structure pointer which can be swapped with the GS_BASE register using the SwapGS instruction. The address stored in this register must be in canonical form (if not canonical, a #GP fault occurs). |

**MSRC000\_0103 Auxiliary Time Stamp Counter (TSC\_AUX)**

[Updated-by-hardware](#). Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:32 | Reserved.   |
| 31:0  | <b>TscAux: auxiliary time stamp counter data.</b> Read-write. It is expected that this is initialized by privileged software to a meaningful value, such as a processor ID. This value is returned in the RDTSCP instruction. |

**MSRC000\_0104 Time Stamp Counter Ratio (TscRateMsr)**

[MSRC000\\_0104 \[Time Stamp Counter Ratio \(TscRateMsr\)\]](#) allows the hypervisor to control the guest's view of the Time Stamp Counter. It provides a multiplier that scales the value returned when [MSR0000\\_0010](#)[TSC] and [MSR0000\\_00E7](#)[MPERF] are read by a guest running under virtualization. This allows the hypervisor to provide a consistent TSC and MPERF rate for a guest process when moving that process between cores that have a differing P0 rate. The TSC Ratio MSR does not affect the value read from the TSC and MPERF MSRs when read when in host mode or when virtualization is not being used or when accessed by code executed in system management mode (SMM) unless the SMM code is executed within a guest container. The TSC Ratio value does not affect the rate of the underlying TSC and MPERF counters, or the value that gets written to the TSC and MPERF MSRs counters on a write by either the host or the guest. The TSC Ratio MSR contains a fixed-point number in 8.32 format, which is 8 bits of integer and 32 bits of fraction. This number is the ratio of the desired P0 frequency to the P0 frequency of the core. The reset value of the TSC Ratio MSR is 1.0, which results in a guest frequency matches the core P0 frequency.

| Bits  | Description   |
|-------|---|
| 63:40 | MBZ.  |
| 39:32 | <b>TscRateMsrInt: time stamp counter rate integer.</b> Read-write. Reset: 01h. Specifies the integer part of the MSR TSC ratio value.             |
| 31:0  | <b>TscRateMsrFrac: time stamp counter rate fraction.</b> Read-write. Reset: 0000_0000h. Specifies the fractional part of the MSR TSC ratio value. |

**MSRC000\_0105 Lightweight Profile Configuration (LWP\_CFG)**

| Bits  | Description   |
|-------|---|
| 63:48 | Reserved.   |
| 47:40 | <b>LwpVector: threshold interrupt vector.</b> Read-write. Reset: 0. Interrupt vector number used by LWP Threshold interrupts. Must be provided if LwpInt is set to 1.   |
| 39:32 | <b>LwpCoreId: core ID.</b> Read-write. Reset: 0. Core identification stored into the trace record. BIOS: <a href="#">CPUID Fn0000_0001_EBX[LocalApicId]</a> . Software is recommended to set this to <a href="#">CPUID Fn0000_0001_EBX[LocalApicId]</a> . |
| 31    | <b>LwpInt: interrupt on threshold overflow.</b> Read-write. Reset: 0. 1=Enable LWP to interrupt on threshold overflow. See <a href="#">CPUID Fn8000_001C_EAX[LwpInt]</a> .  |
| 30:7  | MBZ.  |
| 6     | <b>LwpRNH: core reference clocks not halted event support.</b> MBZ. Reset: 0. 1=Enable LWP to count core reference clocks not halted. See <a href="#">CPUID Fn8000_001C_EAX[LwpRNH]</a> .   |
| 5     | <b>LwpCNH: core clocks not halted event support.</b> MBZ. Reset: 0. 1=Enable LWP to count core clocks not halted. See <a href="#">CPUID Fn8000_001C_EAX[LwpCNH]</a> .   |
| 4     | <b>LwpDME: DC miss event support.</b> MBZ. Reset: 0. 1=Enable LWP to count DC misses. See <a href="#">CPUID Fn8000_001C_EAX[LwpDME]</a> .   |
| 3     | <b>LwpBRE: branch retired event support.</b> Read-write. Reset: 0. 1=Enable LWP to count branches retired. See <a href="#">CPUID Fn8000_001C_EAX[LwpBRE]</a> .  |
| 2     | <b>LwpIRE: instructions retired event support.</b> Read-write. Reset: 0. 1=Enable LWP to count instructions retired. See <a href="#">CPUID Fn8000_001C_EAX[LwpIRE]</a> .  |
| 1     | <b>LwpVAL: LWPVAL instruction support.</b> Read-write. Reset: 0. 1=LWPVAL instruction is enabled. See <a href="#">CPUID Fn8000_001C_EAX[LwpVAL]</a> .   |
| 0     | Reserved.   |

**MSRC000\_0106 Lightweight Profile Control Block Address (LWP\_CBADDR)**

Access to the internal copy of the LWPCB logical line/64 B address. A read returns the current LWPCB address without performing any of the operations described for the SLWPCB instruction. A write to this register with a non-zero value will cause a #GP fault. Use LLWPCB or XRSTOR to load an LWPCB address. Writing a zero to LWP\_CBADDR will immediately disable LWP, discarding any internal state. For instance, an operating system can write a zero to stop LWP when it terminates a thread. All references to the LWPCB implicitly use the DS segment register. Must be 64 B aligned.

| Bits | Description  |
|------|--|
| 63:6 | <b>LwpCbAddr[63:6]: control block logical address.</b> Read-write. Reset: 0. LwpCbAddr[63:0] = {LwpCbAddr[63:6], 000000b}. |
| 5:0  | MBZ.   |

**MSRC000\_0408 Machine Check Misc 4 (Link Thresholding) 1 (MC4\_MISC1)**

**Per-node; Not-same-for-all.** MSRC000\_0408 is associated with the link error type. [MSRC000\\_0408](#) and [MSRC000\\_0409](#) are the block of extended NB machine check miscellaneous registers. [MSRC000\\_0408\[63:32\]](#) is an alias of [D18F3x168](#).

#### **MSRC001\_0010 System Configuration (SYS\_CFG)**

| Bits  | Description  |
|-------|--|
| 63:23 | Reserved.  |
| 22    | <b>Tom2ForceMemTypeWB: top of memory 2 memory type write back.</b> Read-write; <a href="#">SharedC</a> . Reset: 0. 1=The default memory type of memory between 4GB and TOM2 is write back instead of the memory type defined by <a href="#">MSR0000_02FF [MTRR Default Memory Type (MTRRdefType)]</a> [MemType]. For this bit to have any effect, <a href="#">MSR0000_02FF[MtrrDefTypeEn]</a> must be 1. MTRRs and PAT can be used to override this memory type. |
| 21    | <b>MtrrTom2En: MTRR top of memory 2 enable.</b> Read-write; <a href="#">SharedC</a> . Reset: 0. 0= <a href="#">MSRC001_001D [Top Of Memory 2 (TOM2)]</a> is disabled. 1=This register is enabled.  |
| 20    | <b>MtrrVarDramEn: MTRR variable DRAM enable.</b> Read-write; <a href="#">SharedC</a> . Reset: 0. BIOS: 1. 0= <a href="#">MSRC001_001A [Top Of Memory (TOP_MEM)]</a> and IORRs are disabled. 1=These registers are enabled.   |

|      |  |
|------|--|
| 19   | <b>MtrrFixDramModEn: MTRR fixed RdDram and WrDram modification enable.</b> Read-write. Reset: 0. Controls access to <a href="#">MSR0000_02[6F:68,59:58,50]</a> [RdDram, WrDram]. 0=Access type is MBZ; writing 00b does not change the hidden value of <a href="#">MSR0000_02[6F:68,59:58,50]</a> [RdDram, WrDram]. 1=Access type is Read-write. BIOS: This bit should be set to 1 during BIOS initialization of the fixed MTRRs, then cleared to 0 for operation. |
| 18   | <b>MtrrFixDramEn: MTRR fixed RdDram and WrDram attributes enable.</b> Read-write; <a href="#">SharedC</a> . Reset: 0. BIOS: 1. 1=Enables the RdDram and WrDram attributes in <a href="#">MSR0000_02[6F:68,59:58,50]</a> .  |
| 17   | Reserved.  |
| 16   | <b>ChgToDirtyDis: change to dirty disable.</b> Read-write; <a href="#">SharedC</a> . Reset: 0. 1=Disables Change-to-Dirty command; The change-to-dirty condition is handled by evicting the line and then fetching it with a RdBltM command.   |
| 15:0 | Reserved.  |

### MSRC001\_0015 Hardware Configuration (HWCR)

| Bits  | Description  |
|-------|--|
| 63:28 | Reserved.  |
| 27    | Reserved.  |
| 26    | <b>EffFreqCntMwait: effective frequency counting during mwait.</b> Read-write. Reset: 0. Specifies whether <a href="#">MSR0000_00E7</a> [Max Performance Frequency Clock Count (MPERF)] and <a href="#">MSR0000_00E8</a> [Actual Performance Frequency Clock Count (APERF)] increment while the core is in the monitor event pending state. 0=The registers do not increment. 1=The registers increment. See <a href="#">2.5.6</a> [Effective Frequency Interface].  |
| 25    | <b>CpbDis: core performance boost disable.</b> Read-write. Reset: 0. Specifies whether core performance boost is requested to be enabled or disabled. 0= <a href="#">CPB</a> is requested to be enabled. 1= <a href="#">CPB</a> is disabled. See <a href="#">2.5.2.1.1</a> [Application Power Management (APM)]. If core performance boost is disabled while a core is in a boosted P-state, the core will automatically transition to the highest performance non-boosted P-state.  |
| 24    | <b>TscFreqSel: TSC frequency select.</b> Read-only. Reset: 1. 1=The TSC increments at the P0 frequency. This field uses software P-state numbering. See <a href="#">2.5.2.1.2.1</a> [Software P-state Numbering].  |
| 23    | <b>ForceRdWrSzPrb: force probes for RdSized and WrSized.</b> Read-write. Reset: 0. A read returns a 1 if this field is set on any core of the node.<br>1=Forces probes on read-sized and write-sized transactions: <ul style="list-style-type: none"> <li>From the core that are not to the GART aperture.</li> <li>From IO, upstream: <ul style="list-style-type: none"> <li>Except for display refresh transactions (Isoc=1, PassPW=1, RespPassPW=1, Coherent=0) and</li> <li>Except operations that are “Isoc=1, PassPW=1, RespPassPW=1, Coherent=1”. If this case is to the GART aperture, the GART entry’s “Coherent” bit is used and not forced to Coherent=1.</li> </ul> </li> </ul> See <a href="#">2.9.3.1.1</a> [DRAM and MMIO Memory Space].<br>Also applies to table walks for IO accesses to GART aperture.<br>ForceRdWrSzPrb==1 overrides <a href="#">D18F3x90</a> [DisGartTblWlkPrb]. |
| 22:21 | Reserved.  |

|       |   |
|-------|---|
| 20    | <b>IoCfgGpFault: IO-space configuration causes a GP fault.</b> Read-write. Reset: 0. 1=IO-space accesses to configuration space cause a GP fault. The fault is triggered if any part of the IO read/write address range is between CF8h and CFFh, inclusive. These faults only result from single IO instructions, not to string and REP IO instructions. This fault takes priority over the IO trap mechanism described by <a href="#">MSRC001_0054 [IO Trap Control (SMI_ON_IO_TRAP_CTL_STS)]</a> .   |
| 19    | Reserved.   |
| 18    | <p><b>McStatusWrEn: machine check status write enable.</b> Read-write. Reset: 0. McStatusWrEn can be used to debug machine check exception and interrupt handlers. See <a href="#">2.13.3 [Error Injection and Simulation]</a>. See <a href="#">2.13.1 [Machine Check Architecture]</a>.</p> <ul style="list-style-type: none"> <li>1=MCi_STATUS registers are read-write, including reserved fields; do not cause general protection faults; such writes update all implemented bits in these registers; All fields of all threshold registers are Read-write when accessed from MSR space, including Locked, except BlkPtr which is always read-only; McStatusWrEn does not change the access type for the thresholding registers accessed via configuration space (<a href="#">D18F3x160</a>, <a href="#">D18F3x168</a>, and <a href="#">D18F3x170</a>).</li> <li>0=MCi_STATUS registers are readable; writing a non-zero pattern to these registers causes a general protection fault.</li> <li>The MCi_STATUS registers are: <a href="#">MSR0000_0401</a>, <a href="#">MSR0000_0405</a>, <a href="#">MSR0000_0409</a>, <a href="#">MSR0000_040D</a>, <a href="#">MSR0000_0411</a>, <a href="#">MSR0000_0415</a>, <a href="#">MSR0000_0419</a>. McStatusWrEn does not affect the writability of <a href="#">MSR0000_0001</a>; <a href="#">MSR0000_0001</a> is always writable.</li> <li>The thresholding registers affected by McStatusWrEn are: <a href="#">MSR0000_0413</a>, <a href="#">MSRC000_0408</a>, <a href="#">MSRC000_0409</a>.</li> </ul> |
| 17    | <b>Wrap32Dis: 32-bit address wrap disable.</b> Read-write. Reset: 0. 1=Disable 32-bit address wrapping. Software can use Wrap32Dis to access physical memory above 4 Gbytes without switching into 64-bit mode. To do so, software should write a greater-than 4 Gbyte address to <a href="#">MSRC000_0100 [FS Base (FS_BASE)]</a> and <a href="#">MSRC000_0101 [GS Base (GS_BASE)]</a> . Then it would address $\pm 2$ Gbytes from one of those bases using normal memory reference instructions with a FS or GS override prefix. However, the INVLPG, FST, and SSE store instructions generate 32-bit addresses in legacy mode, regardless of the state of Wrap32Dis.   |
| 16:15 | Reserved.   |
| 14    | <b>RsmSpCycDis: RSM special bus cycle disable.</b> IF <a href="#">MSRC001_0015[SmmLock]</a> THEN Read-only ELSE Read-write ENDIF. Reset: 0. 0=A link special bus cycle, SMIACK, is generated on a resume from SMI.  |
| 13    | <b>SmiSpCycDis: SMI special bus cycle disable.</b> IF <a href="#">MSRC001_0015[SmmLock]</a> THEN Read-only ELSE Read-write ENDIF. Reset: 0. 0=A link special bus cycle, SMIACK, is generated when an SMI interrupt is taken.  |
| 12    | <b>HltXSpCycEn: Halt-exit special bus cycle enable.</b> Read-write. Reset: 0. BIOS: 1. 1=A link special bus cycle is generated when exiting from the Halt state. See <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> .  |
| 11    | Reserved.   |
| 10    | <b>MonMwaitUserEn: MONITOR/MWAIT user mode enable.</b> Read-write. Reset: 0. 1=The MONITOR and MWAIT instructions are supported in all privilege levels. 0=The MONITOR and MWAIT instructions are supported only in privilege level 0; these instructions in privilege levels 1 to 3 cause a #UD exception. The state of this bit is ignored if MonMwaitDis is set.   |
| 9     | <b>MonMwaitDis: MONITOR and MWAIT disable.</b> Read-write. Reset: 0. 1=The MONITOR and MWAIT opcodes become invalid. This affects what is reported back through <a href="#">CPUID Fn0000_0001_ECX[Monitor]</a> .  |

|     |  |
|-----|--|
| 8   | <b>IgnneEm: IGNNE port emulation enable.</b> Read-write. Reset: 0. 1=Enable emulation of IGNNE port.   |
| 7:6 | Reserved.  |
| 5   | Reserved.  |
| 4   | <b>INVDWBINVD: INVD to WBINVD conversion.</b> Read-write. Reset: 1. 1=Convert INVD to WBINVD. BIOS: See <a href="#">2.3.3 [Using L2 Cache as General Storage During Boot]</a> .  |
| 3   | <b>TlbCacheDis: cacheable memory disable.</b> Read-write. Reset: 0. 1=Disable performance improvement that assumes that the PML4, PDP, PDE and PTE entries are in cacheable WB DRAM. Operating systems that maintain page tables in any other memory type must set the TlbCacheDis bit to insure proper operation. <ul style="list-style-type: none"> <li>TlbCacheDis does not override the memory type specified by the SMM ASeg and TSeg memory regions. See <a href="#">2.4.8.2.7 [The Protected ASeg and TSeg Areas]</a>.</li> </ul> |
| 2   | Reserved.  |
| 1   | Reserved.  |
| 0   | <b>SmmLock: SMM code lock.</b> Read; write-1-only. Reset: 0. SBIOS: 1. 1=SMM code in the ASeg and TSeg range and the SMM registers are read-only and SMI interrupts are not intercepted in SVM. See <a href="#">2.4.8.2.9 [Locking SMM]</a> .  |

#### MSRC001\_00[18,16] IO Range Base (IORR\_BASE[1:0])

**SharedC.** Reset: X. MSRC001\_0016 and MSRC001\_0017 combine to specify the first IORR range and MSRC001\_0018 and MSRC001\_0019 combine to specify the second IORR range. A core access, with address CPUAddr, is determined to be within IORR address range if the following equation is true:

$\text{CPUAddr}[47:12] \& \text{PhyMask}[47:12] == \text{PhyBase}[47:12] \& \text{PhyMask}[47:12]$ .

BIOS can use the IORRs to create an IO hole within a range of addresses that would normally be mapped to DRAM. It can also use the IORRs to re-assert a DRAM destination for a range of addresses that fall within a bigger IO hole that overlays DRAM. Some key points to consider:

- The IORRs should not cover the range used for the AGP aperture if the GART logic in the NB is enabled.
- The IORRs should be programmed to cover the AGP aperture if the aperture/GART translation is handled by an IO device (e.g., the chipset).

See [2.4.5.1.2 \[Determining The Access Destination for Core Accesses\]](#).

| Bits  | Description   |
|-------|---|
| 63:48 | RAZ.  |
| 47:12 | <b>PhyBase: physical base address.</b> Read-write.  |
| 11:5  | RAZ.  |
| 4     | <b>RdMem: read from memory.</b> Read-write. 1=Read accesses to the range are directed to system memory. 0=Read accesses to the range are directed to IO.  |
| 3     | <b>WrMem: write to memory.</b> Read-write. 1=Write accesses to the range are directed to system memory. 0=Write accesses to the range are directed to IO. |
| 2:0   | RAZ.  |

#### MSRC001\_00[19,17] IO Range Mask (IORR\_MASK[1:0])

**SharedC.** Reset: X. See [MSRC001\\_00\[18,16\]](#).

| Bits  | Description  |
|-------|--|
| 63:48 | RAZ.   |
| 47:12 | <b>PhyMask: physical address mask.</b> Read-write.                                       |
| 11    | <b>Valid.</b> Read-write. 1=The pair of registers that specifies an IORR range is valid. |
| 10:0  | RAZ.   |

#### MSRC001\_001A Top Of Memory (TOP\_MEM)

SharedC. Reset: X.

| Bits  | Description  |
|-------|--|
| 63:48 | RAZ.   |
| 47:23 | <b>TOM[47:23]: top of memory.</b> Read-write. Specifies the address that divides between MMIO and DRAM. This value is normally placed below 4G. From TOM to 4G is MMIO; below TOM is DRAM. See 2.4.5 [System Address Map]. |
| 22:0  | RAZ.   |

#### MSRC001\_001D Top Of Memory 2 (TOM2)

SharedC. Reset: X.

| Bits  | Description  |
|-------|--|
| 63:48 | RAZ.   |
| 47:23 | <b>TOM2[47:23]: second top of memory.</b> Read-write. Specifies the address divides between MMIO and DRAM. This value is normally placed above 4G. From 4G to TOM2 - 1 is DRAM; TOM2 and above is MMIO. See 2.4.5 [System Address Map]. This register is enabled by MSRC001_0010 [System Configuration (SYS_CFG)][MtrrTom2En]. |
| 22:0  | RAZ.   |

#### MSRC001\_001F NB Configuration 1 (NB\_CFG1)

Read-write; Per-node. MSRC001\_001F[31:0] is an alias of D18F3x88. MSRC001\_001F[63:32] is an alias of D18F3x8C.

| Bits  | Description   |
|-------|---|
| 63:55 | Reserved.   |
| 54    | <b>InitApicIdCpuIdLo.</b> Reset: 0. BIOS: 1. 0=Reserved. 1=Selects the format for ApicId; see APIC20. InitApicIdCpuIdLo must be set before D18F0x60[NodeId] is programmed.  |
| 53:51 | Reserved.   |
| 50    | <b>DisOrderRdRsp.</b> Reset: 0. 1=Disables ordered responses to IO link read requests. See 2.12.8 [Response Ordering].  |
| 49:47 | Reserved.   |
| 46    | <b>EnableCf8ExtCfg: enable CF8 extended configuration cycles.</b> Reset: 0. 1=Allows the IO configuration space access method, IOCF8 and IOCF8C, to be used to generate extended configuration cycles by enabling IOCF8[27:24]. |

|       |   |
|-------|---|
| 45    | <b>DisUsSysMgtReqToNcHt: disable upstream system management request to link.</b> Reset: 0. 1=Disables downstream reflection of upstream STPCLK and x86 legacy input system management commands (in order to work around potential deadlock scenarios related to reflection regions).  |
| 44:37 | Reserved.   |
| 36    | <b>DisDatMsk: disable data mask.</b> Reset: 0. BIOS: IF (G34r1    C32r1) THEN 1 ELSE 0 ENDIF. 1=Disables DRAM data masking function; all write requests that are less than one cacheline, a DRAM read is performed before writing the data. If x4 DIMMs are present present , data masking is disabled regardless of the value of this bit.   |
| 35:32 | Reserved.   |
| 31    | <b>DisCohLdtCfg: disable coherent link configuration accesses.</b> Reset: 0. 1=Disables automatic routing of PCI configuration accesses to the processor configuration registers; PCI configuration space accesses which fall within the hard-coded range reserved for processor configuration-space registers are instead routed to the IO link specified by D18F1x[EC:E0] [Configuration Map]. This can be used to effectively hide the configuration registers from software. It can also be used to provide a means for an external chip to route processor configuration accesses according to a scheme other than the hard-coded version. When used, this bit needs to be set on all processors in a system. PCI configuration accesses should not be generated if this bit is not set on all processors. |
| 30:11 | Reserved.   |
| 10    | <b>DisXdsBypass: disable xbar data scheduler bypass.</b> Reset: 0. 1=The crossbar data scheduler bypass is disabled. This bit should be set in systems containing coherent devices that are not covered by this document.   |
| 9     | <b>DisRefUseFreeBuf: disable display refresh to use free list buffers.</b> Reset: 0. 1=In non-IFCM disable display refresh requests from using free list buffers and in IFCM disable isochronous requests from using free list buffers.   |
| 8:0   | Reserved.   |

### MSRC001\_0022 Machine Check Exception Redirection

Reset: 0000\_0000\_0000\_0000h. This register can be used to redirect machine check exceptions (MCEs) to SMIs or vectored interrupts. If both RedirSmiEn and RedirVecEn are set, then undefined behavior results.

| Bits  | Description   |
|-------|---|
| 63:10 | Reserved.   |
| 9     | <b>RedirSmiEn.</b> Read-write. 1=Redirect MCEs (that are directed to this core) to generate an SMI-trigger IO cycle via MSRC001_0056. The status is stored in SMMFEC4[MceRedirSts]. |
| 8     | <b>RedirVecEn.</b> Read-write. 1=Redirect MCEs (that are directed to this core) to generate a vectored interrupt, using the interrupt vector specified in RedirVector.              |
| 7:0   | <b>RedirVector.</b> Read-write. See RedirVecEn.   |

### MSRC001\_00[35:30] Processor Name String

**SharedNC.** Reset: 0000\_0000\_0000\_0000h. BIOS: Table 291. These registers holds the CPUID name string in ASCII. The state of these registers are returned by CPUID instructions, CPUID Fn8000\_000[4:2]\_E[D,C,B,A]X. BIOS should set these registers to the product name for the processor as provided by AMD. Each register contains a block of 8 ASCII characters; the least byte corresponds to the first ASCII character of the block; the most-significant byte corresponds to the last character of the block. MSRC001\_0030 contains the first block of the name string; MSRC001\_0035 contains the last block of the

name string.

Table 290: [Register Mapping](#) for [MSRC001\\_00\[35:30\]](#)

| Register     | Function         |
|--------------|------------------|
| MSRC001_0030 | Characters 7-0   |
| MSRC001_0031 | Characters 15-8  |
| MSRC001_0032 | Characters 23-16 |
| MSRC001_0033 | Characters 31-24 |
| MSRC001_0034 | Characters 39-32 |
| MSRC001_0035 | Characters 47-40 |

See [D18F5x194](#) for the access method to [D18F5x198\\_x\[B:0\]](#).

Table 291: [BIOS Recommendations](#) for [MSRC001\\_00\[35:30\]](#)

| Register     | BIOS                         |
|--------------|------------------------------|
| MSRC001_0030 | {D18F5x198_x1, D18F5x198_x0} |

#### MSRC001\_0049 EX Machine Check Control Mask (MC5\_CTL\_MASK)

Reset: 0000\_0000\_0000\_0000h. BIOS: 0000\_0000\_0000\_0000h. See 2.13.1 [Machine Check Architecture]. See [MSR0000\\_0414](#) [EX Machine Check Control (MC5\_CTL)].

| Bits | Description  |
|------|--|
| 63:0 | See: <a href="#">MSR0000_0414</a> . The format of MC5_CTL_MASK corresponds to MC5_CTL. |

#### MSRC001\_004A FP Machine Check Control Mask (MC6\_CTL\_MASK)

**SharedC.** Reset: 0000\_0000\_0000\_0000h. BIOS: 0000\_0000\_0000\_0000h. See 2.13.1 [Machine Check Architecture]. See [MSR0000\\_0418](#) [FP Machine Check Control (MC6\_CTL)].

| Bits | Description  |
|------|--|
| 63:0 | See: <a href="#">MSR0000_0418</a> . The format of MC6_CTL_MASK corresponds to MC6_CTL. |

#### MSRC001\_00[53:50] IO Trap (SMI\_ON\_IO\_TRAP\_[3:0])

**SharedNC.** Reset: 0000\_0000\_0000\_0000h.

[MSRC001\\_00\[53:50\]](#) and [MSRC001\\_0054](#) provide a mechanism for executing the SMI handler if a an access to one of the specified addresses is detected. Access address and access type checking is performed before IO instruction execution. If the access address and access type match one of the specified IO address and access types, then: (1) the IO instruction is not executed; (2) any breakpoint, other than the single-step breakpoint, set on the IO instruction is not taken (the single-step breakpoint is taken after resuming from SMM); and (3) the SMI-trigger IO cycle specified by [MSRC001\\_0056](#). The status is stored in [SMMFEC4](#)[IoTrapSts].

IO-space configuration accesses are special IO accesses. An IO access is defined as an IO-space configuration access when IO instruction address bits[31:0] are CFCh, CFDh, CFEh, or CFFh when IO-space configuration is enabled ([IOCF8](#)[ConfigEn]). The access address for a configuration space access is the current value of [IOCF8](#)[BusNo, Device, Function, RegNo]. The access address for an IO access that is not a configuration

access is equivalent to the IO instruction address, bits[31:0].

The access address is compared with SmiAddr, and the instruction access type is compared with the enabled access types defined by ConfigSMI, SmiOnRdEn, and SmiOnWrEn. Access address bits[23:0] can be masked with SmiMask.

IO and configuration space trapping to SMI applies only to single IO instructions; it does not apply to string and REP IO instructions.

Table 292: [Register Mapping](#) for [MSRC001\\_00\[53:50\]](#)

| Register     | Function |
|--------------|----------|
| MSRC001_0050 | Range 0  |
| MSRC001_0051 | Range 1  |
| MSRC001_0052 | Range 2  |
| MSRC001_0053 | Range 3  |

| Bits  | Description  |
|-------|--|
| 63    | <b>SmiOnRdEn: enable SMI on IO read.</b> Read-write. 1=Enables SMI generation on a read access.  |
| 62    | <b>SmiOnWrEn: enable SMI on IO write.</b> Read-write. 1=Enables SMI generation on a write access.  |
| 61    | <b>ConfigSmi: configuration space SMI.</b> Read-write. 1=Configuration access. 0=IO access (that is not an IO-space configuration access). |
| 60:56 | Reserved.  |
| 55:32 | <b>SmiMask[23:0].</b> Read-write. SMI IO trap mask. 0=Mask address bit. 1=Do not mask address bit.   |
| 31:0  | <b>SmiAddr[31:0].</b> Read-write. SMI IO trap address.   |

#### MSRC001\_0054 IO Trap Control (SMI\_ON\_IO\_TRAP\_CTL\_STS)

[SharedNC](#). For each of the SmiEn bits below, 1=The trap specified by the corresponding MSR is enabled. See [MSRC001\\_00\[53:50\]](#).

**MSRC001\_0055 Interrupt Pending**

**SharedNC.** This register is used to specify messages that the processor generates under certain conditions, that target the IO hub. One purpose is to ensure that the IO hub can wake the processor out of the stop-grant state when there is a pending interrupt. Otherwise, it is possible for the processor to remain in the stop-grant state while an interrupt is pending in the processor. This is accomplished by sending a message to the IO hub to indicate that the interrupt is pending. There are two message types: a programmable IO-space message and the link INT\_PENDING message defined by the link specification.

If the IO hub does not support the INT\_PENDING message, the IO space message should be selected by IntPndMsg. When this is enabled, the check for a pending interrupt is performed at the end of each IO instruction. If there is a pending interrupt and STPCLK is asserted, the processor executes a byte-size IO access as specified by IORd, IOMsgAddr, and IOMsgData.

If the IO hub supports the INT\_PENDING message, it should be selected by IntPndMsg. The check for a pending interrupt is performed while in the stop-grant state or when entering the stop-grant state. If there is a pending interrupt, the processor broadcasts the INT\_PENDING message. An INT\_PENDING message may not be generated for arbitrated interrupts in multi-node systems.

| Bits  | Description   |

| 63:32 | RAZ.  |
| 31    | Reserved.   |
| 30    | Reserved.   |
| 29    | <b>BmStsClrOnHaltEn: BM_STS clear on Halt enable.</b> Read-write. Reset: 0. BIOS: 1. 1=The core clears BM_STS in the IO hub by writing 0010h to the address specified by IOMsgAddr after the caches are flushed in a non-C0 C-state. This bit has no effect if cache flushing is not enabled in the C-state. See <a href="#">D18F3xDC[CacheFlushOnHaltCtl]</a> and <a href="#">D18F4x11[C:8][CacheFlushEnCstAct0, CacheFlushEnCstAct1, CacheFlushEnCstAct2]</a> . BmStsClrOnHaltEn must be 0 if <a href="#">D18F3xD4[MTC1eEn]</a> is 0. See <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> . |
| 28:27 | Reserved.   |
| 26    | <b>IORd: IO Read.</b> Read-write. Reset: 0. 1=IO read. 0=IO write.  |
| 25    | <b>IntPndMsg: interrupt pending message.</b> Read-write. Reset: 0. Selects the interrupt pending message type. 0=Link-defined INT_PENDING message; 1=Programmable SMI-trigger IO-space message. The status is stored in <a href="#">SMMFEC4[IntPendSmiSts]</a> .  |
| 24    | <b>IntPndMsgDis: interrupt pending message disable.</b> Read-write. Reset: 0. Disable generating the interrupt pending message specified by IntPndMsg.  |
| 23:16 | <b>IOMsgData: IO message data.</b> Read-write. Reset: 0. IO write message data. This field is only used if IORd specifies an IO write message.  |
| 15:0  | <b>IOMsgAddr: IO message address.</b> Read-write. Reset: 0. IO space message address. See <a href="#">2.5.3.5.2 [BIOS Requirements to Initialize Message Triggered C1E]</a> .   |

**MSRC001\_0056 SMI Trigger IO Cycle**

**Not-same-for-all.** Reset: 0000\_0000\_0000\_0000h. See [2.4.8.2.3 \[SMI Sources And Delivery\]](#). This register specifies an IO cycle that may be generated when a local SMI trigger event occurs. If IoCycleEn is set and there is a local SMI trigger event, then the IO cycle generated is a byte read or write, based on IoRd, to address IoPortAddress. If the cycle is a write, then IoData contains the data written. If the cycle is a read, the value read is discarded. If IoCycleEn is clear and a local SMI trigger event occurs, then undefined behavior results.

### MSRC001\_0060 BIST Results

Read; GP-write. Reset: 0000\_0000\_xxxx\_xxxxh. This register provides BIST results after each reset. The results provided here are identical to the values provided in EAX. If ([31:0]==0000\_0000h) then no BIST failures were detected.

| Bits | Description |
|------|-------------|
| 63:0 | Reserved.   |

### MSRC001\_0061 P-state Current Limit

Read; GP-write; [SharedC](#); updated-by-hardware. See [2.5.2 \[P-states\]](#).

| Bits | Description  |
|------|--|
| 63:7 | RAZ.   |
| 6:4  | <b>PstateMaxVal: P-state maximum value.</b> Specifies the lowest-performance non-boosted P-state (highest non-boosted value) allowed. Attempts to change <a href="#">MSRC001_0062</a> [PstateCmd] to a lower-performance P-state (higher value) are clipped to the value of this field. This field uses software P-state numbering. See <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> .   |
| 3    | RAZ.   |
| 2:0  | <b>CurPstateLimit: current P-state limit.</b> Specifies the highest-performance non-boosted P-state (lowest value) allowed. CurPstateLimit is always bounded by <a href="#">MSRC001_0061</a> [PstateMaxVal]. Attempts to change the CurPstateLimit to a value greater (lower performance) than <a href="#">MSRC001_0061</a> [PstateMaxVal] leaves CurPstateLimit unchanged. This field uses software P-state numbering. See <a href="#">MSRC001_0071</a> [CurPstateLimit] and <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . |

### MSRC001\_0062 P-state Control

| Bits | Description   |
|------|---|
| 63:3 | MBZ.  |
| 2:0  | <b>PstateCmd: P-state change command.</b> Read-write; Not-same-for-all. Cold reset value varies by product; after a warm reset, value initializes to the P-state the core was in prior to the reset. Writes to this field cause the core to change to the indicated non-boosted P-state number, specified by <a href="#">MSRC001_00[6B:64]</a> . 0=P0, 1=P1, etc. P-state limits are applied to any P-state requests made through this register. Reads from this field return the last written value, regardless of whether any limits are applied. This field uses software P-state numbering. See <a href="#">2.5.2 [P-states]</a> and <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . |

### MSRC001\_0063 P-state Status

Read; GP-write; [SharedC](#); [Updated-by-hardware](#).

| Bits | Description   |
|------|---|
| 63:3 | RAZ.  |
| 2:0  | <b>CurPstate: current P-state.</b> Cold reset values vary by product. This field provides the frequency component of the current non-boosted P-state of the core (regardless of the source of the P-state change, including <a href="#">MSRC001_0062</a> [PstateCmd] and <a href="#">D18F3xC4 [SBI P-state Limit]</a> ; see <a href="#">2.5.2.1.7 [Core P-state Transition Behavior]</a> for information on how these interact). 0=P0, 1=P1, etc. The value of this field is updated when the COF transitions to a new value associated with a P-state. This field uses software P-state numbering. See <a href="#">2.5.2 [P-states]</a> and <a href="#">2.5.2.1.2.1 [Software P-state Numbering]</a> . |

### MSRC001\_00[6B:64] P-state [7:0]

[Per-node](#). Cold reset: Product-specific. Each of these registers specify the frequency and voltage associated with each of the core P-states.

Table 293: Register Mapping for MSRC001\_00[6B:64]

| Register     | Function  |
|--------------|-----------|
| MSRC001_0064 | P-state 0 |
| MSRC001_0065 | P-state 1 |
| MSRC001_0066 | P-state 2 |
| MSRC001_0067 | P-state 3 |
| MSRC001_0068 | P-state 4 |
| MSRC001_0069 | P-state 5 |
| MSRC001_006A | P-state 6 |
| MSRC001_006B | P-state 7 |

The CpuVid field in these registers is required to be programmed to the same value in all cores of a processor, but are allowed to be different between processors in a multi-processor system. All other fields in these registers are required to be programmed to the same value in each core of the coherent fabric. See 2.5.2 [P-states].

When D18F4x15C[BoostLock]=1, MSRC001\_00[6B:64][CpuVid, CpuDid, CpuFid] have special write requirements associated with them.

Table 294: P-state Definitions

| Term    | Definition  |
|---------|---|
| CoreCOF | Core current operating frequency in MHz. $\text{CoreCOF} = 100 * (\text{MSRC001\_00[6B:64][CpuFid]} + 10h) / (2^{\text{MSRC001\_00[6B:64][CpuDid]}})$ . |

| Bits   | Description   |        |             |     |                                    |     |                                      |     |                                       |     |          |
|--------|---|--------|-------------|-----|------------------------------------|-----|--------------------------------------|-----|---------------------------------------|-----|----------|
| 63     | <b>PstateEn.</b> Read-write. 1=The P-state specified by this MSR is valid. 0=The P-state specified by this MSR is not valid. The purpose of this field is to indicate if the rest of the P-state information in the register is valid after a reset; it controls no hardware.   |        |             |     |                                    |     |                                      |     |                                       |     |          |
| 62:42  | RAZ.  |        |             |     |                                    |     |                                      |     |                                       |     |          |
| 41:40  | <b>IddDiv: current divisor.</b> Read-write. See IddValue.   |        |             |     |                                    |     |                                      |     |                                       |     |          |
| 39:32  | <b>IddValue: current value.</b> Read-write. After a reset, IddDiv and IddValue combine to specify the expected maximum current dissipation of a single core that is in the P-state corresponding to the MSR number. These values are intended to be used to create ACPI-defined _PSS objects (see 2.5.2.1.11 [ACPI Processor P-state Objects]) and to perform the 2.5.2.1.9 [Processor-Systemboard Power Delivery Compatibility Check]. The values are expressed in amps; they are not intended to convey final product power levels; they may not match the power levels specified in the Power and Thermal Datasheets. These fields may be subsequently altered by software; they do not affect the hardware behavior. These fields are encoded as follows: <table> <tr> <th>IddDiv</th><th>Description</th></tr> <tr> <td>00b</td><td>IddValue / 1 A, Range: 0 to 255 A.</td></tr> <tr> <td>01b</td><td>IddValue / 10 A, Range: 0 to 25.5 A.</td></tr> <tr> <td>10b</td><td>IddValue / 100 A, Range: 0 to 2.55 A.</td></tr> <tr> <td>11b</td><td>Reserved</td></tr> </table> | IddDiv | Description | 00b | IddValue / 1 A, Range: 0 to 255 A. | 01b | IddValue / 10 A, Range: 0 to 25.5 A. | 10b | IddValue / 100 A, Range: 0 to 2.55 A. | 11b | Reserved |

| 5:0   | <b>CpuFid: core frequency ID.</b> Read-write. Specifies the core frequency multiplier. The core COF is a function of CpuFid and CpuDid, and defined by CoreCOF. This field and CpuDid must be programmed to the requirements specified in MSRC001_0071[MaxCpuCof] and D18F3xD4[MaxSwPstateCpuCof]. Writes to a non-boosted P-state with frequencies greater than D18F3xD4[MaxSwPstateCpuCof] are ignored. Writes to a boosted P-state with frequencies greater than MSRC001_0071[MaxCpuCof] are ignored. If D18F4x15C[BoostLock]=1, then CpuDid for boosted P-states can only be written with values that are greater than or equal to the reset value in CpuDid. If D18F4x15C[BoostLock]=1, then CpuFid for boosted P-states can only be written with values that are less than or equal to the reset value in CpuFid. CpuFid must be less than or equal to 2Fh. |      |             |    |             |    |             |    |             |    |             |    |              |       |          |

### MSRC001\_0070 COFVID Control

**Updated-by-hardware.** Cold reset: Product-specific. There is one register implemented for each core. This register includes several fields that are identical to MSRC001\_00[6B:64]. It is controlled by hardware for P-state transitions. It may also be used by software to directly control the current COF or VID. Accesses to this register that result in invalid COFs or VIDs are ignored. See 2.5.2 [P-states].

| Bits  | Description   |
|-------|---|
| 63:32 | RAZ.  |
| 31:24 | <b>NbVid: Northbridge VID.</b> IF (MSRC001_0071[NbPstateDis] ) THEN Read-only. ELSE Read-write. ENDIF. See D18F5x1[6C:60][NbVid].             |
| 23    | RAZ.  |
| 22    | <b>NbPstate: Northbridge P-state.</b> IF (MSRC001_0071[NbPstateDis]) THEN Read-only. ELSE Read-write. ENDIF. See MSRC001_00[6B:64][NbPstate]. |
| 21:19 | RAZ.  |

|       |  |
|-------|--|
| 18:16 | <b>PstateId: P-state identifier.</b> Read-write. This field is required to provide the P-state number that is associated with the values of the other fields in this register. This value is used by the logic to determine if the P-state is increasing or decreasing. This field uses hardware P-state numbering. See <a href="#">2.5.2.1.2.2 [Hardware P-state Numbering]</a> . |
| 15:9  | <b>CpuVid: core VID.</b> Read-write. See <a href="#">MSRC001_00[6B:64][CpuVid]</a> .   |
| 8:6   | <b>CpuDid: core divisor ID.</b> Read-write. See <a href="#">MSRC001_00[6B:64][CpuDid]</a> . The PstateId field must be updated to cause a new CpuDid value to take effect.   |
| 5:0   | <b>CpuFid: core frequency ID.</b> Read-write. See <a href="#">MSRC001_00[6B:64][CpuFid]</a> . The PstateId field must be updated to cause a new CpuFid value to take effect.   |

### MSRC001\_0071 COFVID Status

See [2.5.2 \[P-states\]](#).

| Bits  | Description   |
|-------|---|
| 63:59 | <b>MaxNbCof: maximum NB COF.</b> Read-only; <a href="#">Per-node</a> . Reset: Product-specific. Specifies the maximum NB COF supported by the processor. The maximum frequency is 200 MHz * MaxNbCof, if MaxNbCof is greater than zero; if MaxNbCof = 00h, then there is no frequency limit. Any attempt to change the NB COF to a frequency greater than specified by this field is ignored.       |
| 58:56 | <b>CurPstateLimit: current P-state limit.</b> Read-only; <a href="#">Per-node</a> ; <a href="#">Updated-by-hardware</a> . Value: Product-specific. Provides the current lowest-performance P-state limit number. This register uses hardware P-state numbering. See <a href="#">MSRC001_0061[CurPstateLimit]</a> and <a href="#">2.5.2.1.2.2 [Hardware P-state Numbering]</a> .                     |
| 55    | Reserved.   |
| 54:49 | <b>MaxCpuCof: maximum core COF.</b> Read-only; <a href="#">Per-node</a> . Reset: Product-specific. Specifies the maximum CPU COF supported by the processor. The maximum frequency is 100 MHz * MaxCpuCof, if MaxCpuCof is greater than zero; if MaxCpuCof = 00h, then there is no frequency limit. Any attempt to change a CPU COF to a frequency greater than specified by this field is ignored. |
| 48:42 | <b>MinVid: minimum voltage.</b> Read-only; <a href="#">Per-node</a> . Reset: Product-specific. Specifies the VID code corresponding to the minimum voltage (highest VID code) that the processor drives. 00h indicates that no minimum VID code is specified. See <a href="#">2.5.1 [Processor Power Planes And Voltage Control]</a> .  |
| 41:35 | <b>MaxVid: maximum voltage.</b> Read-only; <a href="#">Per-node</a> . Reset: Product-specific. Specifies the VID code corresponding to the maximum voltage (lowest VID code) that the processor drives. 00h indicates that no maximum VID code is specified. See <a href="#">2.5.1 [Processor Power Planes And Voltage Control]</a> .   |
| 34:32 | <b>StartupPstate: startup P-state number.</b> Read-only; <a href="#">Per-node</a> . Reset: Product-specific. Specifies the cold reset VID, FID and DID for the core based on the P-state number selected. StartupPstate uses hardware P-state numbering. See <a href="#">MSRC001_00[6B:64]</a> and <a href="#">2.5.2.1.2.2 [Hardware P-state Numbering]</a> .                                       |
| 31:25 | <b>CurNbVid: current NB VID.</b> Read-only; <a href="#">Updated-by-hardware</a> . Cold reset: Product-specific. Specifies the current VDDNB voltage. See <a href="#">D18F5x174[CurNbVid]</a> .  |
| 24    | Reserved.   |
| 23    | <b>NbPstateDis: NB P-states disabled.</b> Read-only. Value: <a href="#">D18F5x174[NbPstateDis]</a> . See <a href="#">D18F5x174[NbPstateDis]</a> . 0=NB P-state frequency and voltage changes are supported. See <a href="#">D18F5x170[SwNbPstateLoDis, NbPstateDisOnP0]</a> . 1=NB P-state frequency and voltage changes are disabled.  |

|       |  |
|-------|--|
| 22:19 | Reserved.  |
| 18:16 | <b>CurPstate: current P-state.</b> Read-only; <a href="#">Not-same-for-all</a> ; <a href="#">Updated-by-hardware</a> . Cold reset: Product-specific. Specifies the current P-state requested by the core. This field uses hardware P-state numbering. See <a href="#">MSRC001_0063[CurPstate]</a> and <a href="#">2.5.2.1.2.2 [Hardware P-state Numbering]</a> . When a P-state change is requested, the value in this field is updated once all required frequency and voltage transitions are completed. |
| 15:9  | <b>CurCpuVid: current core VID.</b> Read-only; <a href="#">Updated-by-hardware</a> . Cold Reset: Product-specific. Specifies the current VDD voltage.  |
| 8:6   | <b>CurCpuDid: current core divisor ID.</b> Read-only; <a href="#">Not-same-for-all</a> ; <a href="#">Updated-by-hardware</a> . Cold Reset: Product-specific. Specifies the current CpuDid of the core. See <a href="#">MSRC001_00[6B:64]</a> . When a P-state change is requested, the value in this field is updated once all required frequency and voltage transitions are completed.   |
| 5:0   | <b>CurCpuFid: current core frequency ID.</b> Read-only; <a href="#">Not-same-for-all</a> ; <a href="#">Updated-by-hardware</a> . Cold Reset: Product-specific. Specifies the current CpuFid of the core. See <a href="#">MSRC001_00[6B:64]</a> . When a P-state change is requested, the value in this field is updated once all required frequency and voltage transitions are completed.   |

#### MSRC001\_0072 SBI P-state Limit

SBI-only; Per-node. See [2.13.4 \[Sideband Interface \(SBI\)\]](#). If ([D18F3xE8\[MultiNodeCpu\]](#)==1) then [D18F3xC4](#) is only programmed on internal node 0 ([D18F3xE8\[IntNodeNum\]](#)==00b); [D18F3xC4](#) on internal node 1 should not be written. This register specifies a P-state limit for all cores in the processor. See [2.5.2 \[P-states\]](#).

| Bits  | Description  |
|-------|--|
| 63:19 | Reserved.  |
| 18:16 | <b>NumBoostStates: number of boosted states.</b> Read-only. Value: <a href="#">D18F4x15C[NumBoostStates]</a> . Specifies the number of P-states that are considered boosted P-states. See <a href="#">2.5.2.1.1 [Application Power Management (APM)]</a> . Provides APML read the ability to convert between hardware and software P-states for <a href="#">MSRC001_0072[PstateLimit]</a> and <a href="#">MSRC001_003E[HtcPstateLimit]</a> . |
| 15:11 | Reserved.  |
| 10:8  | <b>PstateLimit: P-state limit select.</b> Read-write from APML interface. Reset: 0. Specifies a hardware P-state limit for all cores when activated by PstateLimitEn. Not changed on a write if the value written is greater than <a href="#">MSRC001_0061[PstateMaxVal]</a> + NumBoostStates. See <a href="#">D18F3xC4[PstateLimit]</a> .   |
| 7:1   | Reserved.  |
| 0     | <b>PstateLimitEn: P-state limit enable.</b> Read-write from APML interface. Reset: 0. 1=PstateLimit is enabled. See <a href="#">D18F3xC4[PstateLimitEn]</a> .  |

**MSRC001\_0073 C-state Base Address**

Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:16 | Reserved.   |
| 15:0  | <b>CstateAddr: C-state address.</b> Read-write. Specifies the IO addresses trapped by the core for C-state entry requests. A value of 0 in this field specifies that the core does not trap any IO addresses for C-state entry. Writing values greater than FFF8h into this field result in undefined behavior. All other values cause the core to trap IO addresses CstateAddr through CstateAddr+7. See <a href="#">2.5.3.2 [C-state Request Interface]</a> , and <a href="#">D18F4x11[C:8]</a> . |

**MSRC001\_0075 APML TDP Limit**

SBI-only; Per-node.

| Bits    | Description  |      |             |     |                   |     |                            |         |  |     |                              |
|---------|--|------|-------------|-----|-------------------|-----|----------------------------|---------|--|-----|------------------------------|

| 15:12   | Unused.  |      |             |     |                   |     |                            |         |  |     |                              |
| 11:0    | <b>ApmlTdpLimit.</b> Read-only. Reset: 0. Specifies the maximum sum of TDP for all cores on the processor allowed by APML. If the consumed power exceeds the <a href="#">ApmlTdpLimit</a> , a P-state limit is applied to all cores on the processor to reduce the power consumption so that it remains within the TDP limit. See <a href="#">2.5.2.1.1.1 [TDP Limiting]</a> . A value of 0 is returned if <a href="#">ApmlTdpLimit</a> is disabled.   |      |             |     |                   |     |                            |         |  |     |                              |

**MSRC001\_0077 Processor Power in TDP**

Read-only; SBI-only; Per-node. [BasePwrWatts](#), [ProcessorPwrWatts](#), and [CurrPwrWatts](#) are fixed point integers with 8 bits to the left of the decimal point and 16 bits to the right of the decimal point; The value in W is defined by the following equation:  $(\text{PwrWatts}[23:0] * 0.00001525) \text{ W}$ .

Power in watts can be calculated as follows:

- [BasePwrWatts\[23:0\]](#):
  - Specifies in watts the maximum amount of power consumed by the processor for NB and logic external

to the core.

- $\text{BasePwrWatts}[23:0] = (\text{BaseTdp}[15:0] * \text{Tdp2Watt}[15:0])$ . MSB's above [23] of multiply result must be 0 because result is not allowed to be  $\geq 256$  W.
- **ProcessorPwrWatts[23:0]:**
  - Specifies in watts the maximum amount of power the processor can support.
  - $\text{ProcessorPwrWatts}[23:0] = (\text{ProcessorTdp}[15:0] * \text{Tdp2Watt}[15:0])$ . MSB's above [23] of multiply result must be 0 because result is not allowed to be  $\geq 256$  W
- **CurrPwrWatts[23:0]:**
  - Specifies in watts the current amount of power being consumed by the processor.
  - **CurrPwrWatts[23:0] calculation:**
    - $\text{TempTdp} = \text{MSRC001\_0078}[\text{ApmTdpLimit}] - (\text{signed})(\text{MSRC001\_0078}[\text{TdpRunAvgAccCap}] / (2^{(\text{MSRC001\_0078}[\text{RunAvgRange}] + 1))) + \text{BaseTdp}$ .
    - $\text{CurrPwrWatts}[23:0] = (\text{TempTdp} * \text{Tdp2Watt}[15:0])$ .
  - If **D18F3xE8**[MultiNodeCpu]=1, this field must be calculated only from internal node 0 (**D18F3xE8**[IntNodeNum]=00b).

| 10:0  | Unused.   |

**MSRC001\_0111 SMM Base Address (SMM\_BASE)**

Reset: 0000\_0000\_0003\_0000h. This holds the base of the SMM memory region. The value of this register is stored in the save state on entry into SMM (see [2.4.8.2.5 \[SMM Save State\]](#)) and it is restored on returning from SMM. The 16-bit CS (code segment) selector is loaded with SmmBase[19:4] on entering SMM. SmmBase[3:0] is required to be 0. The SMM base address can be changed in two ways:

- The SMM base address, at offset FF00h in the SMM state save area, may be changed by the SMI handler. The RSM instruction updates SmmBase with the new value.
- Normal WRMSR access to this register.

| Bits  | Description  |
|-------|--|
| 63:32 | Reserved.  |
| 31:0  | <b>SmmBase</b> . IF <a href="#">MSRC001_0015</a> [SmmLock] THEN Read-only ELSE Read-write ENDIF. |

**MSRC001\_0112 SMM TSeg Base Address (SMMAddr)**

Reset: 0000\_0000\_0000\_0000h.

See [2.4.8.2 \[System Management Mode \(SMM\)\]](#) and [2.4.5.1 \[Memory Access to the Physical Address Space\]](#). See [MSRC001\\_0113](#) for more information about the ASeg and TSeg address ranges.

Each CPU access, directed at CPUAddr, is determined to be in the TSeg range if the following is true:

$\text{CPUAddr}[47:17] \& \text{TSegMask}[47:17] == \text{TSegBase}[47:17] \& \text{TSegMask}[47:17]$ .

For example, if TSeg spans 256 KB and starts at the 1 MB address. The [MSRC001\\_0112](#)[TSegBase] would be set to 0010\_0000h and the [MSRC001\\_0113](#)[TSegMask] to FFFC\_0000h (with zeros filling in for bits[16:0]). This results in a TSeg range from 0010\_0000 to 0013\_FFFFh.

| Bits  | Description  |
|-------|--|
| 63:48 | Reserved.  |
| 47:17 | <b>TSegBase[47:17]: TSeg address range base.</b> IF <a href="#">MSRC001_0015</a> [SmmLock] THEN Read-only ELSE Read-write ENDIF. |
| 16:0  | Reserved.  |

### **MSRC001\_0113 SMM TSeg Mask (SMMMask)**

Reset: 0000\_0000\_0000\_0000h.

See [2.4.8.2 \[System Management Mode \(SMM\)\]](#).

The ASeg address range is located at a fixed address from A0000h–BFFFFh. The TSeg range is located at a variable base (specified by [MSRC001\\_0112](#)[TSegBase]) with a variable size (specified by [MSRC001\\_0113](#)[TSegMask]). These ranges provide a safe location for SMM code and data that is not readily accessible by non-SMM applications. The SMI handler can be located in one of these two ranges, or it can be located outside these ranges. These ranges must never overlap each other.

This register specifies how accesses to the ASeg and TSeg address ranges are control as follows:

- If [A, T]Valid=0, then the address range is accessed as specified by MTRRs, regardless of whether the CPU is in SMM or not.
- If [A, T]Valid=1, then:
  - If in SMM, then:
    - If [A, T]Close=0, then the accesses are directed to DRAM with memory type as specified in [A, T]MTypeDram.
    - If [A, T]Close=1, then instruction accesses are directed to DRAM with memory type as specified in [A, T]MTypeDram and data accesses are directed at MMIO space and with attributes based on [A, T]MTypeIoWc.
  - If not in SMM, then the accesses are directed at MMIO space with attributes based on [A, T]MTypeIoWc.

### MSRC001\_0114 Virtual Machine Control (VM\_CR)

| Bits  | Description   |
|-------|---|
| 63:32 | Reserved.   |
| 31:5  | MBZ.  |
| 4     | <b>SvmeDisable: SVM disable.</b> See Lock for the access type of this field. Reset: 0. 1= <a href="#">MSRC000_0080</a> [SVME] is MBZ. 0= <a href="#">MSRC000_0080</a> [SVME] is read-write. Attempting to set this field when ( <a href="#">MSRC000_0080</a> [SVME]==1) causes a #GP fault, regardless of the state of Lock. See the APM2 section titled “Enabling SVM” for software use of this field. |
| 3     | <b>Lock: SVM lock.</b> Read; write-1-only; cleared-by-hardware. Reset: 0. See <a href="#">MSRC001_0118</a> [SvmLockKey] for the condition that causes hardware to clear this field. 1=SvmeDisable is read-only. 0=SvmeDisable is read-write.  |
| 2     | <b>DisA20m: disable A20 masking.</b> Read-write; set-by-hardware. Reset: 0. 1=Disables A20 masking. This bit is set by hardware when the SKINIT instruction is executed.  |
| 1     | <b>InterceptInit: intercept INIT.</b> Read-write; set-by-hardware. Reset: 0. This bit controls how INIT is delivered in host mode. This bit is set by hardware when the SKINIT instruction is executed. 0=INIT delivered normally. 1=INIT translated into a SX interrupt.   |
| 0     | <b>DPD: debug port disable.</b> Read-write; set-by-hardware. Reset: 0. Set by hardware when the SKINIT instruction is executed. 1=HDT is disabled. 0=HDT may be enabled.  |

**MSRC001\_0115 IGNNE**

| Bits  | Description  |
|-------|--|
| 63:32 | Reserved.  |
| 31:1  | MBZ.   |
| 0     | <b>IGNNE: current IGNNE state.</b> Read-write. Reset: X. This bit controls the current state of the processor internal IGNNE signal. |

**MSRC001\_0116 SMM Control (SMM\_CTL)**

IF (MSRC001\_0015[SmmLock]) THEN GP-read-write. ELSE GP-read; write-only. ENDIF.

The bits in this register are processed in the order of: SmmEnter, SmiCycle, SmmDismiss, RsmCycle and SmmExit. However, only the following combination of bits may be set in a single write (all other combinations result in undefined behavior):

- SmmEnter and SmiCycle.
- SmmEnter and SmmDismiss.
- SmmEnter, SmiCycle and SmmDismiss.
- SmmExit and RsmCycle.

Software is responsible for ensuring that SmmEnter and SmmExit operations are properly matched and are not nested.

| Bits | Description  |
|------|--|
| 63:5 | MBZ.   |
| 4    | <b>RsmCycle: send RSM special cycle.</b> 1=Send a RSM special cycle. |
| 3    | <b>SmmExit: exit SMM.</b> 1=Exit SMM.                                |
| 2    | <b>SmiCycle: send SMI special cycle.</b> 1=Send a SMI special cycle. |
| 1    | <b>SmmEnter: enter SMM.</b> 1=Enter SMM.                             |
| 0    | <b>SmmDismiss: clear SMI.</b> 1=Clear the SMI pending flag.          |

**MSRC001\_0117 Virtual Machine Host Save Physical Address (VM\_HSAVE\_PA)**

| Bits  | Description  |
|-------|--|
| 63:48 | MBZ.   |
| 47:12 | <b>VM_HSAVE_PA: physical address of host save area.</b> Read-write. Reset: 0. This register contains the physical address of a 4-KB region where VMRUN saves host state and where vm-exit restores host state from. Writing this register causes a #GP if (FF_FFFF_Fh>=VM_HSAVE_PA>=FD_0000_0h). |
| 11:0  | MBZ.   |

**MSRC001\_0118 SVM Lock Key**

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>SvmLockKey: SVM lock key.</b> RAZ; write. Writes to this register when <a href="#">MSRC001_0114[Lock]==0</a> modify SvmLockKey. If (( <a href="#">MSRC001_0114[Lock]==1</a> ) && (SvmLockKey!=0) && (The write value==The value stored in SvmLockKey)) for a write to this register then hardware updates <a href="#">MSRC001_0114[Lock]=0</a> . |

#### MSRC001\_011A Local SMI Status

Reset: 0000\_0000\_0000\_0000h. This registers returns the same information that is returned in [SMMFEC4 \[Local SMI Status\]](#) portion of the SMM save state. The information in this register is only updated when [MSRC001\\_0116\[SmmDismiss\]](#) is set by software.

| Bits  | Description                                      |
|-------|--|
| 63:32 | Reserved.  |
| 31:0  | See <a href="#">SMMFEC4 [Local SMI Status]</a> . |

#### MSRC001\_0140 OS Visible Work-around MSR0 (OSVW\_ID\_Length)

Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description   |
|-------|---|
| 63:16 | Reserved.   |
| 15:0  | <b>OSVWIdLength: OS visible work-around ID length.</b> Read-write. See the revision guide for the definition of this field. See <a href="#">1.2 [Reference Documents]</a> . |

#### MSRC001\_0141 OS Visible Work-around MSR1 (OSVW Status)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description   |
|------|---|
| 63:0 | <b>OsvwStatusBits: OS visible work-around status bits.</b> Read-write. See the revision guide for the definition of this field. See <a href="#">1.2 [Reference Documents]</a> . |

#### MSRC001\_020[A,8,6,4,2,0] Performance Event Select (PERF\_CTL[5:0])

Reset: 0000\_0000\_0000\_0000h. See [2.7.1 \[Core Performance Monitor Counters\]](#). See [MSRC001\\_00\[03:00\]](#). To accurately start counting with the write that enables the counter, disable the counter when changing the event and then enable the counter with a second MSR write.

Table 295: [Register Mapping](#) for [MSRC001\\_020\[A,8,6,4,2,0\]](#)

| Register     | Function  |
|--------------|-----------|
| MSRC001_0200 | Counter 0 |
| MSRC001_0202 | Counter 1 |
| MSRC001_0204 | Counter 2 |
| MSRC001_0206 | Counter 3 |
| MSRC001_0208 | Counter 4 |
| MSRC001_020A | Counter 5 |

The edge count mode increments the counter when a transition happens on the monitored event. If the event selected is changed without disabling the counter, an extra edge is falsely detected when the first event is a static 0 and the second event is a static one. To avoid this false edge detection, disable the counter when changing the event and then enable the counter with a second MSR write.

|      |  |
|------|--|
| 15:8 | <b>UnitMask: event qualification.</b> Read-write. Each UnitMask bit further specifies or qualifies the event specified by EventSelect. All events selected by UnitMask are simultaneously monitored. Unless otherwise stated, the UnitMask values shown may be combined (logically ORed) to select any desired combination of the sub-events for a given event. In some cases, certain combinations can result in misleading counts, or the UnitMask value is an ordinal rather than a bit mask. These situations are described where applicable, or should be obvious from the event descriptions. For events where no UnitMask table is shown, the UnitMask is <b>Unused</b> . |
| 7:0  | <b>EventSelect[7:0]: event select.</b> Read-write. EventSelect[11:0] = {EventSelect[11:8], EventSelect[7:0]}. EventSelect specifies the event or event duration in a processor unit to be counted by the corresponding PERF_CTR[5:0] register. The events are specified in <a href="#">3.15 [Core Performance Counter Events]</a> . Some events are reserved; when a reserved event is selected, the results are undefined.  |

### MSRC001\_020[B,9,7,5,3,1] Performance Event Counter (PERF\_CTR[5:0])

See [MSRC001\\_020\[A,8,6,4,2,0\] \[Performance Event Select \(PERF\\_CTL\[5:0\]\)\]](#). See [MSRC001\\_00\[07:04\]](#).

Table 296: [Register Mapping](#) for [MSRC001\\_020\[B,9,7,5,3,1\]](#)

| Register     | Function  |
|--------------|-----------|
| MSRC001_0201 | Counter 0 |
| MSRC001_0203 | Counter 1 |
| MSRC001_0205 | Counter 2 |
| MSRC001_0207 | Counter 3 |
| MSRC001_0209 | Counter 4 |
| MSRC001_020B | Counter 5 |

| Bits  | Description  |
|-------|--|
| 63:48 | RAZ.   |
| 47:0  | <b>CTR: performance counter value.</b> Read-write. Reset: 0. |

### MSRC001\_024[6,4,2,0] Northbridge Performance Event Select (NB\_PERF\_CTL[3:0])

Per-node. See [D18F5x\[70,60,50,40\]](#) and [D18F5x\[74,64,54,44\]](#).

Table 297: [Register Mapping](#) for [MSRC001\\_024\[6,4,2,0\]](#)

| Register     | Function  |
|--------------|-----------|
| MSRC001_0240 | Counter 0 |
| MSRC001_0242 | Counter 1 |
| MSRC001_0244 | Counter 2 |
| MSRC001_0246 | Counter 3 |

These registers are used to specify the events counted by the [MSRC001\\_024\[7,5,3,1\] \[Northbridge Performance Event Counter \(NB\\_PERF\\_CTR\[3:0\]\)\]](#) and to control other aspects of their operation. Each performance counter supported has a corresponding event-select register that controls its operation. [3.16 \[NB Performance Counter Events\]](#) shows the events and unit masks supported by the processor.

To accurately start counting with the write that enables the counter, disable the counter when changing the event and then enable the counter with a second MSR write.

The edge count mode increments the counter when a transition happens on the monitored event. If the event selected is changed without disabling the counter, an extra edge is falsely detected when the first event is a static 0 and the second event is a static one. To avoid this false edge detection, disable the counter when changing the event and then enable the counter with a second MSR write.

The northbridge performance counter registers can be used to track events in the northbridge. Northbridge events include all memory controller events, crossbar events, HyperTransport™ interface events, and L3 cache events as documented in 3.16 [NB Performance Counter Events]. Since the northbridge performance counter register are shared by all cores on a node, monitoring of northbridge events should only be performed by one core on a node.

| Bits  | Description  |
|-------|--|
| 63:36 | Reserved.  |
| 35:32 | <b>EventSelect[11:8]: performance event select.</b> Read-write. Reset: 0. See EventSelect[7:0].  |
| 31:23 | Reserved.  |
| 22    | <b>En: enable performance counter.</b> Read-write. Reset: 0. 1= Performance event counter is enabled.  |
| 21    | Reserved.  |
| 20    | <b>Int: enable APIC interrupt.</b> Read-write. Reset: 0. 1=APIC performance counter LVT interrupt is enabled to generate an interrupt via APIC340 [LVT Performance Monitor] to all APIC's on this node when the performance counter overflows.   |
| 19:16 | Reserved.  |
| 15:8  | <b>UnitMask: event qualification.</b> Read-write. Reset: 0. Each UnitMask bit further specifies or qualifies the event specified by EventSelect. All events selected by UnitMask are simultaneously monitored. Unless otherwise stated, the UnitMask values shown may be combined (logically ORed) to select any desired combination of the sub-events for a given event. In some cases, certain combinations can result in misleading counts, or the UnitMask value is an ordinal rather than a bit mask. These situations are described where applicable, or should be obvious from the event descriptions. For events where no UnitMask table is shown, the UnitMask is <b>Unused</b> . |
| 7:0   | <b>EventSelect[7:0]: event select.</b> Read-write. Reset: 0. This field, along with EventSelect[11:8] above, combine to form the 12-bit event select field, EventSelect[11:0]. EventSelect specifies the event or event duration in a processor unit to be counted by the corresponding NB_PERF_CTR[3:0] register. The events are specified in 3.16 [NB Performance Counter Events]. Some events are reserved; when a reserved event is selected, the results are undefined.   |

#### MSRC001\_024[7,5,3,1] Northbridge Performance Event Counter (NB\_PERF\_CTR[3:0])

Per-node. See D18F5x[78,68,58,48] and D18F5x[7C,6C,5C,4C].

Table 298: Register Mapping for MSRC001\_024[7,5,3,1]

| Register     | Function  |
|--------------|-----------|
| MSRC001_0241 | Counter 0 |
| MSRC001_0243 | Counter 1 |
| MSRC001_0245 | Counter 2 |
| MSRC001_0247 | Counter 3 |

The northbridge provides four 48-bit performance counters. Each counter can monitor a different event specified by [MSRC001\\_024\[6,4,2,0\]](#) [[Northbridge Performance Event Select \(NB\\_PERF\\_CTL\[3:0\]\)](#)]. The accuracy of the counters is not ensured.

Performance counters are used to count specific processor events, such as data-cache misses, or the duration of events, such as the number of clocks it takes to return data from memory after a cache miss. During event counting, the processor increments the counter when it detects an occurrence of the event. During duration measurement, the processor counts the number of processor clocks it takes to complete an event. Each performance counter can be used to count one event, or measure the duration of one event at a time.

In addition to the RDMSR instruction, the NB\_PERF\_CTR[3:0] registers can be read using a special read performance-monitoring counter instruction, RDPMC.

Writing the performance counters can be useful if there is an intention for software to count a specific number of events, and then trigger an interrupt when that count is reached. An interrupt can be triggered when a performance counter overflows. Software should use the WRMSR instruction to load the count as a two's-complement negative number into the performance counter. This causes the counter to overflow after counting the appropriate number of times.

The performance counters are not assured of producing identical measurements each time they are used to measure a particular instruction sequence, and they should not be used to take measurements of very small instruction sequences. The RDPMC instruction is not serializing, and it can be executed out-of-order with respect to other instructions around it. Even when bound by serializing instructions, the system environment at the time the instruction is executed can cause events to be counted before the counter value is loaded into EDX:EAX.

| Bits  | Description  |
|-------|--|
| 63:48 | RAZ.   |
| 47:0  | <b>CTR: performance counter value.</b> Read-write. Reset: 0. Returns the current value of the event counter. |

### MSRC001\_1030 IBS Fetch Control (IC\_IBS\_CTL)

Reset: 0000\_0000\_0000\_0000h. See 2.7.3 [Instruction Based Sampling (IBS)].

The IBS fetch sampling engine is described as follows:

- The periodic fetch counter is an internal 20-bit counter:
  - The periodic fetch counter [19:4] is set to IbsFetchCnt[19:4] and the periodic fetch counter [3:0] is set according to IbsRandEn when IbsFetchEn is changed from 0 to 1.
  - It increments for every fetch cycle that completes when IbsFetchEn=1 and IbsFetchVal=0.
    - The periodic fetch counter is undefined when IbsFetchEn=0 or IbsFetchVal=1.
    - When IbsFetchCnt[19:4] is read it returns the current value of the periodic fetch counter [19:4].
- When the periodic fetch counter reaches {IbsFetchMaxCnt[19:4],0h} and the selected instruction fetch completes or is aborted:
  - IbsFetchVal is set to 1.
    - Drivers can't assume that IbsFetchCnt[19:4] is 0 when IbsFetchVal==1.
  - The status of the operation is written to the IBS fetch registers (this register, [MSRC001\\_1031](#) and [MSRC001\\_1032](#)).
  - An interrupt is generated as specified by [MSRC001\\_103A](#). The interrupt service routine associated with this interrupt is responsible for saving the performance information stored in IBS execution registers.

| Bits  | Description  |
|-------|--|
| 63:58 | Reserved.  |
| 57    | <b>IbsRandEn: random instruction fetch tagging enable</b> . Read-write. 1=Bits [3:0] of the fetch counter are randomized when IbsFetchEn is set to start the fetch counter. 0=Bits [3:0] of the fetch counter are set to 0h when IbsFetchEn is set to start the fetch counter. |
| 56    | <b>IbsL2TlbMiss: instruction cache L2TLB miss</b> . Read-only. 1=The instruction fetch missed in the L2 TLB.   |

| 52    | <b>IbsPhyAddrValid: instruction fetch physical address valid.</b> Read-only. 1=The physical address in <a href="#">MSRC001_1032</a> and the IbsL1TlbPgSz field are valid for the instruction fetch.   |      |             |     |      |     |      |     |      |     |          |
| 51    | <b>IbsIcMiss: instruction cache miss.</b> Read-only. 1=The instruction fetch missed in the instruction cache.   |      |             |     |      |     |      |     |      |     |          |
| 50    | <b>IbsFetchComp: instruction fetch complete.</b> Read-only. 1=The instruction fetch completed and the data is available for use by the instruction decoder.   |      |             |     |      |     |      |     |      |     |          |
| 49    | <b>IbsFetchVal: instruction fetch valid.</b> Read-write; set-by-hardware. 1=New instruction fetch data available. When this bit is set, the fetch counter stops counting and an interrupt is generated as specified by <a href="#">MSRC001_103A</a> . This bit must be cleared and IbsFetchCnt[19:4] must be written to 0000h for the fetch counter to start counting again.                      |      |             |     |      |     |      |     |      |     |          |
| 48    | <b>IbsFetchEn: instruction fetch enable.</b> Read-write. 1=Instruction fetch sampling is enabled.   |      |             |     |      |     |      |     |      |     |          |
| 47:32 | <b>IbsFetchLat: instruction fetch latency.</b> Read-only. Reset: X. Indicates the number of clock cycles from when the instruction fetch was initiated to when the data was delivered to the core. If the instruction fetch is abandoned before the fetch completes, this field returns the number of clock cycles from when the instruction fetch was initiated to when the fetch was abandoned. |      |             |     |      |     |      |     |      |     |          |
| 31:16 | <b>IbsFetchCnt[19:4].</b> Read-write; updated-by-hardware. The current value of bits [19:4] of the periodic fetch counter.  |      |             |     |      |     |      |     |      |     |          |
| 15:0  | <b>IbsFetchMaxCnt[19:4].</b> Read-write. Specifies maximum count value of the periodic fetch counter. Programming this field to 0000h and setting IbsFetchEn results in undefined behavior. Bits 19:4 of the maximum count are programmed in the field. Bits [3:0] of the maximum count are always 0000b.   |      |             |     |      |     |      |     |      |     |          |

#### MSRC001\_1031 IBS Fetch Linear Address (IC\_IBS\_LIN\_AD)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>IbsFetchLinAd: instruction fetch linear address.</b> Read-write; updated-by-hardware. Provides the linear address in canonical form for the tagged instruction fetch. |

#### MSRC001\_1032 IBS Fetch Physical Address (IC\_IBS\_PHYS\_AD)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>IbsFetchPhysAd: instruction fetch physical address.</b> Read-write; updated-by-hardware. Provides the physical address for the tagged instruction fetch. The lower 12 bits are not modified by address translation, so they are always the same as the linear address. This field contains valid data only if <a href="#">MSRC001_1030</a> [IbsPhyAddrValid] is asserted. |

**MSRC001\_1033 IBS Execution Control (SC\_IBS\_CTL)**

Reset: 0000\_0000\_0000\_0000h. See 2.7.3 [Instruction Based Sampling (IBS)].

The IBS execution sampling engine is described as follows for IbsOpCntCtl==1. If IbsOpCntCtl==1n then references to “periodic op counter” mean “periodic cycle counter”.

- The periodic op counter is an internal 27-bit counter:
  - It is set to IbsOpCurCnt[26:0] when IbsOpEn is changed from 0 to 1.
  - It increments every dispatched op when IbsOpEn=1 and IbsOpVal=0.
    - The periodic op counter is undefined when IbsOpEn=0 or IbsOpVal=1.
  - When IbsOpCurCnt[26:0] is read then it returns the current value of the periodic micro-op counter [26:0].
- When the periodic micro-op counter reaches IbsOpMaxCnt:
  - The next dispatched micro-op is tagged if IbsOpCntCtl==1. A valid op in the next dispatched line is tagged if IbsOpCntCtl==0. See IbsOpCntCtl.
  - The periodic micro-op counter [26:7]=0; [6:0] is randomized by hardware.
- The periodic micro-op counter is not modified when a tagged micro-op is flushed.
- When a tagged micro-op is retired:
  - IbsOpVal is set to 1.
    - Drivers can't assume that IbsOpCurCnt is 0 when IbsOpVal==1.
  - The status of the operation is written to the IBS execution registers (this register, [MSRC001\\_1034](#), [MSRC001\\_1035](#), [MSRC001\\_1036](#), [MSRC001\\_1037](#), [MSRC001\\_1038](#) and [MSRC001\\_1039](#)).
  - An interrupt is generated as specified by [MSRC001\\_103A](#). The interrupt service routine associated with this interrupt is responsible for saving the performance information stored in IBS execution registers.

| Bits        | Description  |      |             |             |          |             |                            |

**MSRC001\_1034 IBS Op Logical Address (IBSOP\_RIP)**

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>IbsOpRip: micro-op logical address.</b> Read-write; updated-by-hardware. Logical address in canonical form for the instruction that contains the tagged micro-op. |

**MSRC001\_1035 IBS Op Data (SC\_IBS\_DATA)**

Read-write; updated-by-hardware. Reset: 0000\_0000\_0000\_0000h.

| Bits  | Description  |
|-------|--|
| 63:39 | Reserved.  |
| 38    | <b>IbsRipInvalid: RIP is invalid.</b> 1=Tagged operation RIP is invalid. Support for this indicated by <a href="#">CPUID Fn8000_001B_EAX[RipInvalidChk]</a> .  |
| 37    | <b>IbsOpBrnRet: branch retired.</b> 1=Tagged operation was a branch that retired.  |
| 36    | <b>IbsOpBrnMisp: mispredicted branch micro-op.</b> 1=Tagged operation was a branch micro-op that was mispredicted. Qualified by IbsOpBrnRet==1.  |
| 35    | <b>IbsOpBrnTaken: taken branch micro-op.</b> 1=Tagged operation was a branch micro-op that was taken. Qualified by IbsOpBrnRet==1.   |
| 34    | <b>IbsOpReturn: return micro-op.</b> 1=Tagged operation was return micro-op. Qualified by IbsOpBrnRet==1.  |
| 33    | <b>IbsOpMispReturn: mispredicted return micro-op.</b> 1=Tagged operation was a mispredicted return micro-op. Qualified by IbsOpBrnRet==1.  |
| 32    | <b>IbsOpBrnResync: resync micro-op.</b> 1=Tagged operation was resync micro-op.  |
| 31:16 | <b>IbsTagToRetCtr: micro-op tag to retire count.</b> This field returns the number of cycles from when the micro-op was tagged to when the micro-op was retired. This field is equal to IbsCompToRetCtr when the tagged micro-op is a NOP. |
| 15:0  | <b>IbsCompToRetCtr: micro-op completion to retire count.</b> This field returns the number of cycles from when the micro-op was completed to when the micro-op was retired.  |

**MSRC001\_1036 IBS Op Data 2 (IbsOpData2)**

Reset: 0000\_0000h. Northbridge data is only valid for load operations that miss both the L1 data cache and the L2 cache. If a load operation crosses a cache line boundary, the data returned in this register is the data for the access to the lower cache line.

| Bits  | Description   |

| 3 | <b>IbsDcL2TlbMiss: data cache L2TLB miss.</b> 1=The physical address for the tagged load or store operation was not present in the data cache L2TLB.                                 |
| 2 | <b>IbsDcL1TlbMiss: data cache L1TLB miss.</b> 1=The physical address for the tagged load or store operation was not present in the data cache L1TLB.                                 |
| 1 | <b>IbsStOp: store op.</b> 1=Tagged operation is a store operation.   |
| 0 | <b>IbsLdOp: load op.</b> 1=Tagged operation is a load operation.   |

#### MSRC001\_1038 IBS DC Linear Address (DC\_IBS\_LIN\_ADDR)

Reset: 0000\_0000\_0000\_0000h.

| Bits | Description  |
|------|--|
| 63:0 | <b>IbsDcLinAd.</b> Read-write; updated-by-hardware. Provides the linear address in canonical form for the tagged load or store operation. This field contains valid data only if <a href="#">MSRC001_1037</a> [IbsDcLinAddrValid] is asserted. |

#### MSRC001\_1039 IBS DC Physical Address (DC\_IBS\_PHYS\_ADDR)

| Bits  | Description   |
|-------|---|
| 63:48 | RAZ.  |
| 47:0  | <b>IbsDcPhysAd: load or store physical address.</b> Read-write; updated-by-hardware. Reset: 0. Provides the physical address for the tagged load or store operation. The lower 12 bits are not modified by address translation, so they are always the same as the linear address. This field contains valid data only if <a href="#">MSRC001_1037</a> [IbsDcPhyAddrValid] is asserted. |

#### MSRC001\_103A IBS Control

| Bits | Description  |
|------|--|
| 63:9 | Reserved.  |
| 8    | <b>LvtOffsetVal: local vector table offset valid.</b> Read-only; <a href="#">GP-write</a> ; <a href="#">Per-node</a> . Reset: 0. See <a href="#">D18F3x1CC</a> [LvtOffsetVal]. |
| 7:4  | Reserved.  |
| 3:0  | <b>LvtOffset: local vector table offset.</b> Read-only; <a href="#">GP-write</a> ; <a href="#">Per-node</a> . Reset: 0. See <a href="#">D18F3x1CC</a> [LvtOffset].             |

**MSRC001\_103B IBS Branch Target Address (BP\_IBSTGT\_RIP)**

Reset: 0000\_0000\_0000\_0000h. Support for this register indicated by [CPUID Fn8000\\_001B\\_EAX](#)[BrnTrgt].

| Bits | Description  |
|------|--|
| 63:0 | <b>IbsBrTarget</b> . Read-write; updated-by-hardware. The logical address in canonical form for the branch target. Contains a valid target if non-0. Qualified by <a href="#">MSRC001_1035</a> [IbsOpBrnRet]==1. |

**3.15 Core Performance Counter Events**

This section provides the core performance counter events that may be selected through [MSRC001\\_020](#)[A,8,6,4,2,0] [Performance Event Select (PERF\_CTL[5:0])][EventSelect and UnitMask]. See that register and [MSRC001\\_020](#)[B,9,7,5,3,1] [Performance Event Counter (PERF\_CTR[5:0])].

For NB performance counter events see [2.7.2 \[NB Performance Monitor Counters\]](#) and [3.16 \[NB Performance Counter Events\]](#).

**3.15.1 PMCx0[1F:00] Events (FP)****PMCx000 FPU Pipe Assignment**

[PERF\\_CTL](#)[3]. . The number of operations (uops) and dual-pipe uops dispatched to each of the 4 FPU execution pipelines. This event reflects how busy the FPU pipelines are and may be used for workload characterization. This includes all operations performed by x87, MMX, and SSE instructions, including moves. Each increment represents a one-cycle dispatch event. This event is a speculative event. (See [PMCx0CB](#)). Since this event includes non-numeric operations it is not suitable for measuring MFLOPS. The number of events logged per cycle can vary from 0 to 8 and must use [PERF\\_CTL](#)[3].

| UnitMask | Description                                     |
|----------|---|
| 7        | Total number dual-pipe uops assigned to Pipe 3. |
| 6        | Total number dual-pipe uops assigned to Pipe 2. |
| 5        | Total number dual-pipe uops assigned to Pipe 1. |
| 4        | Total number dual-pipe uops assigned to Pipe 0. |
| 3        | Total number uops assigned to Pipe 3.           |
| 2        | Total number uops assigned to Pipe 2.           |
| 1        | Total number uops assigned to Pipe 1.           |
| 0        | Total number uops assigned to Pipe 0.           |

**PMCx001 FP Scheduler Empty**

[PERF\\_CTL](#)[5:3]. This is a speculative event. The number of cycles in which the FPU scheduler is empty. Note that some ops like FP loads bypass the scheduler; see the FP MAS for the full list of “no pipe” ops that bypass the scheduler. Invert this ([MSRC001\\_020](#)[A,8,6,4,2,0][Inv]=1) to count cycles in which at least one FPU operation is present in the FPU.

**PMCx003 Retired Floating Point Ops**

[PERF\\_CTL](#)[3]. This is a retire-based event. The number of retired FLOPS. The number of events logged per

cycle can vary from 0 to 32.

| UnitMask | Description  |
|----------|--|
| 7        | Double precision multiply-add FLOPS. Multiply-add counts as 2 FLOPS. |
| 6        | Double precision divide/square root FLOPS.                           |
| 5        | Double precision multiply FLOPS.                                     |
| 4        | Double precision add/subtract FLOPS.                                 |
| 3        | Single precision multiply-add FLOPS. Multiply-add counts as 2 FLOPS. |
| 2        | Single-precision divide/square root FLOPS.                           |
| 1        | Single-precision multiply FLOPS.                                     |
| 0        | Single-precision add/subtract FLOPS.                                 |

#### PMCx004 Number of Move Elimination and Scalar Op Optimization

[PERF\\_CTL\[3\]](#). This is a dispatch based speculative event, and is useful for measuring the effectiveness of the Move elimination and Scalar code optimization schemes. The number of events logged per cycle can vary from 0 to 8 and must use [PERF\\_CTL\[3\]](#).

| UnitMask | Description   |
|----------|---|
| 7:4      | Reserved.   |
| 3        | Number of Scalar ops optimized.   |
| 2        | Number of Ops that are candidates for optimization (have Z-bit either set or pass). |
| 1        | Number of SSE Move Ops eliminated.  |
| 0        | Number of SSE Move Ops.   |

#### PMCx005 Retired Serializing Ops

[PERF\\_CTL\[5:3\]](#). The number of serializing ops retired.

| UnitMask | Description   |
|----------|---|
| 7:4      | Reserved.   |
| 3        | x87 control word mispredict traps due to mispredictions in RC or PC, or changes in mask bits.       |
| 2        | x87 bottom-executing uops retired.  |
| 1        | SSE control word mispredict traps due to mispredictions in RC, FTZ or DAZ, or changes in mask bits. |
| 0        | SSE bottom-executing uops retired.  |

#### PMCx006 Number of Cycles that a Bottom-Execute uop is in the FP Scheduler

[PERF\\_CTL\[5:3\]](#). This is a speculative event.

### 3.15.2 PMCx0[3F:20] Events (LS)

#### PMCx020 Segment Register Loads

**PERF\_CTL[5:0]**. The number of segment register loads performed.

| UnitMask | Description |

| 0        | ES          |

#### PMCx021 Pipeline Restart Due to Self-Modifying Code

**PERF\_CTL[5:0]**. The number of pipeline restarts that were caused by self-modifying code (a store that hits any instruction that's been fetched for execution beyond the instruction doing the store).

#### PMCx022 Pipeline Restart Due to Probe Hit

**PERF\_CTL[5:0]**. The number of pipeline restarts caused by an invalidating probe hitting on a speculative out-of-order load.

#### PMCx023 Load Queue/Store Queue Full

**PERF\_CTL[2:0]**. The number of cycles that the load queue (LDQ) or store queue (STQ) is full. The load queue holds loads that missed the data cache and are waiting on a refill; the store queue holds stores waiting to retire. This condition stalls further data cache accesses, although such stalls may be overlapped by independent instruction execution.

| UnitMask | Description   |
|----------|---|
| 7:2      | Reserved.   |
| 1        | The number of cycles that the store buffer is full. |
| 0        | The number of cycles that the load buffer is full.  |

#### PMCx024 Locked Operations

**PERF\_CTL[5:0]**. This event covers locked operations performed and their non-speculative execution time.

| UnitMask | Description  |
|----------|--|
| 7:4      | Reserved.  |
| 3        | The number of cycles spent in non-speculative phase, including the cache miss penalty. |

|   |   |
|---|---|
| 2 | The number of cycles spent in non-speculative phase, excluding cache miss penalty. In the absence of a cache miss, the UnitMask[3] counter counts 8 cycles more for each locked operation than the UnitMask[2] counter. |
| 1 | Reserved.   |
| 0 | The number of locked instructions executed.   |

#### PMCx026 Retired CLFLUSH Instructions

[PERF\\_CTL\[5:0\]](#). The number of retired CLFLUSH instructions. This is a non-speculative event.

#### PMCx027 Retired CPUID Instructions

[PERF\\_CTL\[5:0\]](#). The number of CPUID instructions retired.

#### PMCx029 LS Dispatch

[PERF\\_CTL\[5:0\]](#). Counts the number of operations dispatched to the LS unit.

| UnitMask | Description     |
|----------|-----------------|
| 7:3      | Reserved.       |
| 2        | Load-op-Stores. |
| 1        | Stores.         |
| 0        | Loads.          |

#### PMCx02A Canceled Store to Load Forward Operations

[PERF\\_CTL\[5:0\]](#). Counts the number of canceled store to load forward operations.

| UnitMask | Description   |
|----------|---|
| 7:1      | Reserved.   |
| 0        | Either “store is smaller than load” or “different starting byte but partial overlap”. |

#### PMCx02B SMIs Received

[PERF\\_CTL\[5:0\]](#). Counts the number of SMIs received.

#### PMCx030 Executed CLFLUSH Instructions

[PERF\\_CTL\[5:0\]](#). The number of executed CLFLUSH instructions. This is a speculative event.

### 3.15.3 PMCx0[5F:40] Events (DC)

#### PMCx040 Data Cache Accesses

[PERF\\_CTL\[5:0\]](#). The number of accesses to the data cache for load and store references. This may include certain microcode scratchpad accesses, although these are generally rare. This event is a speculative event.

**PMCx041 Data Cache Misses**

**PERF\_CTL[5:0]**. The number of data cache references which missed in the data cache. This event is a speculative event. Only the first miss for a given line is included; access attempts by other instructions while the refill is still pending are not included in this event. Each event reflects one 64 B cache line refill, and counts of this event are the same as, or very close to, the combined count for **PMCx042**.

| UnitMask | Description  |
|----------|--|
| 7:2      | Reserved.  |
| 1        | First streaming store to a 64 B cache line.                    |
| 0        | First data cache miss or streaming store to a 64 B cache line. |

**PMCx042 Data Cache Refills from L2 or System**

**PERF\_CTL[5:0]**. The number of data cache refills satisfied from the L2 cache and/or the system. Each increment reflects a 64 B transfer. This event is a speculative event.

| UnitMask | Description  |
|----------|--|
| 7:4      | Reserved.  |
| 3        | Fill with read data error.                         |
| 2        | Reserved.  |
| 1        | Early valid status turned out to be invalid.       |
| 0        | Fill with good data. (Final valid status is valid) |

**PMCx043 Data Cache Refills from System**

**PERF\_CTL[2:0]**. The number of L1 cache refills satisfied from the system (system memory or another cache), as opposed to the L2. Each increment reflects a 64 B transfer. This event is a speculative event.

**PMCx045 Unified TLB Hit**

**PERF\_CTL[2:0]**. The number of TLB accesses that miss in the L1 DTLB or L1 and L2 ITLBs and hit in the unified TLB (UCTLB). This event is a speculative event.

| UnitMask | Description                           |
|----------|---------------------------------------|
| 7        | Reserved.                             |
| 6        | 1 GB unified TLB hit for instruction. |
| 5        | 2 MB unified TLB hit for instruction. |
| 4        | 4 KB unified TLB hit for instruction. |
| 3        | Reserved.                             |
| 2        | 1 GB unified TLB hit for data.        |
| 1        | 2 MB unified TLB hit for data.        |
| 0        | 4 KB unified TLB hit for data.        |

**PMCx046 Unified TLB Miss**

**PERF\_CTL[2:0]**. The number of TLB accesses that miss in all TLBs. This event is a speculative event.

| UnitMask | Description                            |
|----------|--|
| 7        | Reserved.                              |
| 6        | 1 GB unified TLB miss for instruction. |
| 5        | 2 MB unified TLB miss for instruction. |
| 4        | 4 KB unified TLB miss for instruction. |
| 3        | Reserved.                              |
| 2        | 1 GB unified TLB miss for data.        |
| 1        | 2 MB unified TLB miss for data.        |
| 0        | 4 KB unified TLB miss for data.        |

**PMCx047 Misaligned Accesses**

**PERF\_CTL[5:0]**. The number of data cache accesses that are misaligned. These are accesses which cross an 8 B boundary. They incur an extra cache access (reflected in **PMCx040**), and an extra cycle of latency on reads. This event is a speculative event.

**PMCx04B Prefetch Instructions Dispatched**

**PERF\_CTL[5:0]**. The number of prefetch instructions dispatched by the decoder. Such instructions may or may not cause a cache line transfer. Any Dcache and L2 accesses, hits and misses by prefetch instructions are included in these types of events. This event is a speculative event.

| UnitMask | Description                       |
|----------|-----------------------------------|
| 7:3      | Reserved.                         |
| 2        | NTA (PrefetchNTA)                 |
| 1        | Store (PrefetchW)                 |
| 0        | Load (Prefetch, PrefetchT0/T1/T2) |

**PMCx052 Ineffective Software Prefetches**

**PERF\_CTL[5:0]**. The number of software prefetches that did not fetch data outside of the processor core.

| UnitMask | Description                      |
|----------|----------------------------------|
| 7:4      | Reserved.                        |
| 3        | Software prefetch hit in the L2. |
| 2:1      | Reserved.                        |
| 0        | Software prefetch hit in the L1. |

### 3.15.4 PMCx[1,0][7F:60] Events (CU)

#### PMCx065 Memory Requests by Type

[PERF\\_CTL\[2:0\]](#). These events reflect accesses to uncacheable (UC), write-combining (WC), and streaming store (SS) activity to WB memory.

| UnitMask | Description   |
|----------|---|
| 7        | Requests to non-cacheable (WC+/SS, but not WC) memory, consisting of reads and 64 B sized buffer flushes. |
| 6:2      | Reserved.   |
| 1        | Requests to non-cacheable (WC, but not WC+/SS) memory, consisting of reads and 64 B sized buffer flushes. |
| 0        | Requests to non-cacheable (UC) memory.  |

#### PMCx067 Data Prefetcher

[PERF\\_CTL\[2:0\]](#).

| UnitMask | Description        |
|----------|--------------------|
| 7:4      | Reserved.          |
| 3:2      | Reserved.          |
| 1        | Prefetch attempts. |
| 0        | Reserved.          |

#### PMCx068 MAB Requests

[PERF\\_CTL\[2:0\]](#). Events [PMCx068](#) and [PMCx069](#) reflect utilization of the Miss Address buffers (MABs), which handle IC, DC, TLB, WCC, and WCB related requests. The UnitMask[BufferID] is an encoded value which selects one of the MABs. [PMCx068](#) counts the number of cacheable L2 misses handled by the selected MAB; [PMCx069](#) counts the number of cycles the selected MAB is busy waiting for the NB response. The average latency seen by the selected MAB is the number of cycles spent waiting ([PMCx069](#)) divided by the number of requests ([PMCx068](#)).

| UnitMask | Description   |      |             |      |        |        |          |
|----------|---|------|-------------|------|--------|--------|----------|
| 7:0      | <b>BufferID.</b> <table> <tr> <th>Bits</th><th>Description</th></tr> <tr> <td>27-0</td><td>MAB ID</td></tr> <tr> <td>255-28</td><td>Reserved</td></tr> </table> | Bits | Description | 27-0 | MAB ID | 255-28 | Reserved |
| Bits     | Description   |      |             |      |        |        |          |
| 27-0     | MAB ID  |      |             |      |        |        |          |
| 255-28   | Reserved  |      |             |      |        |        |          |

#### PMCx069 MAB Wait Cycles

[PERF\\_CTL\[2:0\]](#). See [PMCx068](#).

| UnitMask | Description   |
|----------|---|
| 7:0      | <b>BufferID.</b> See: <a href="#">PMCx068</a> [BufferID]. |

### PMCx06C Response From System on Cache Refills

**PERF\_CTL[2:0]**. The number of responses from the system for cache refill requests. The UnitMask may be used to select specific cache coherency states. Each increment represents one 64 B cache line transferred from the system (DRAM or another cache, including another core on the same node) to the data cache, instruction cache or L2 cache (for data prefetcher and TLB table walks). Modified-state responses may be for Dcache store miss refills, PrefetchW software prefetches, hardware prefetches for a store-miss stream, or Change-to-Dirty requests that get a dirty (Owned) probe hit in another cache. Exclusive responses may be for any Icache refill, Dcache load miss refill, other software prefetches, hardware prefetches for a load-miss stream, or TLB table walks that miss in the L2 cache; Shared responses may be for any of those that hit a clean line in another cache.

| UnitMask | Description   |
|----------|---|
| 7:6      | Reserved.   |
| 5        | Modified unwritten  |
| 4        | Data Error  |
| 3        | Owned   |
| 2        | Shared  |
| 1        | Modified (if modified unwritten is disabled by <a href="#">D18F0x68[ATMMoDeEn]==0</a> );<br>Modified unwritten (if modified unwritten is enabled by <a href="#">D18F0x68[ATMMoDeEn]==1</a> ). |
| 0        | Exclusive   |

### PMCx06D Octwords Written to System

**PERF\_CTL[2:0]**. The number of OW (16 B) data transfers from the processor to the system. These may be part of a 64 B cache line writeback or a 64 B dirty probe hit response, each of which would cause four increments; or a partial or complete Write Combining buffer flush (Sized Write), which could cause from one to four increments.

| UnitMask | Description        |
|----------|--------------------|
| 7:6      | Reserved.          |
| 5:1      | Reserved.          |
| 0        | OW write transfer. |

### PMCx075 Cache Cross-invalidates

**PERF\_CTL[2:0]**. These reflect internal probes for Icache or Dcache misses that hit in the Dcache or Icache, causing the line to be invalidated. These may result from code modification, or data being located too close to code, or virtual address aliasing. The aliasing cases arise when a physical memory location is referenced via two or more virtual addresses which differ in bits 14:12.

| UnitMask | Description  |
|----------|--|
| 7:4      | Reserved.  |
| 3        | IC Invalidates DC (execution of recently modified code, or modified data too close to code). |
| 2        | IC Invalidates IC (aliasing)   |

|   |  |
|---|--|
| 1 | DC Invalidates DC (aliasing)   |
| 0 | DC Invalidates IC (modification of cached instructions, or of data located too close to code). |

### PMCx076 CPU Clocks not Halted

**PERF\_CTL[2:0]**. The number of core clocks that the CPU is not in a halted state (due to STPCLK or a HLT instruction). This event allows system idle time to be automatically factored out from IPC (or CPI) measurements, providing the OS halts the CPU when going idle. If the OS goes into an idle loop rather than halting, such calculations are influenced by the IPC of the idle loop. The core clock frequency varies with P-states.

### PMCx07D Requests to L2 Cache

**PERF\_CTL[2:0]**. The number of requests to the L2 cache for Icache or Dcache fills, or page table lookups for the TLB. These events reflect only read requests to the L2; writes to the L2 are indicated by **PMCx07E**. See **PMCx081**, **PMCx082**, **PMCx083**, **PMCx041**, **PMCx042**, **PMCx043**.

| UnitMask | Description                 |
|----------|-----------------------------|
| 7        | Reserved.                   |
| 6        | L2 cache prefetcher request |
| 5        | Reserved.                   |
| 4        | Canceled request            |
| 3        | NB probe request            |
| 2        | TLB fill (page table walks) |
| 1        | DC fill                     |
| 0        | IC fill                     |

### PMCx07E L2 Cache Misses

**PERF\_CTL[2:0]**. The number of requests that miss in the L2 cache. This may include some amount of speculative activity. The IC-fill-miss and DC-fill-miss events tend to mirror the Icache and Dcache refill-from-system **PMCx083** and **PMCx043**, and tend to include more speculative activity than those events.

| UnitMask | Description  |
|----------|--|
| 7:6      | Reserved.  |
| 5        | Reserved.  |
| 4        | L2 Cache Prefetcher request  |
| 3        | Reserved.  |
| 2        | TLB page table walk  |
| 1        | DC fill (includes possible replays, whereas <b>PMCx041</b> does not) |
| 0        | IC fill  |

### PMCx07F L2 Fill/Writeback

**PERF\_CTL[2:0]**. Each increment represents a 64 B cache line transfer.

| UnitMask | Description   |
|----------|---|
| 7:3      | Reserved.   |
| 2        | L2 Clean Writebacks to system   |
| 1        | L2 Writebacks to system (Clean and Dirty)   |
| 0        | L2 fills from system. Note: Fills for non-temporal software prefetch and WP-memtype fills also are counted in this event even though they don't get cached in L2. |

### PMcX165 Page Splintering

**PERF\_CTL[2:0]**. Counts the number of TLB reloads where a large page is installed into the TLB as a smaller page size.

| UnitMask | Description  |
|----------|--|
| 7:3      | Reserved.  |
| 2        | Host page size is larger than the guest page size.                               |
| 1        | Splintering due to MTRRs, IORRs, APIC, TOMs or other special address region.     |
| 0        | Guest page size is larger than the host page size when nested paging is enabled. |

### PMcX16C L2 Prefetcher Trigger Events

**PERF\_CTL[2:0]**.

| UnitMask | Description                       |
|----------|-----------------------------------|
| 7:2      | Reserved.                         |
| 1        | Store L1 miss seen by prefetcher. |
| 0        | Load L1 miss seen by prefetcher.  |

### 3.15.5 PMcX[1,0][9F:80] Events (IC)

All instruction cache events are speculative events unless specified otherwise.

#### PMcX080 Instruction Cache Fetches

**PERF\_CTL[2:0]**. The number of instruction cache accesses by the instruction fetcher. Each access is an aligned 32 B read, from which a varying number of instructions may be decoded.

#### PMcX081 Instruction Cache Misses

**PERF\_CTL[2:0]**. The number of instruction fetches and prefetch requests that miss in the instruction cache. This is typically equal to or very close to the sum of events 82h and 83h. Each miss results in a 64 B cache line refill.

#### PMcX082 Instruction Cache Refills from L2

**PERF\_CTL[2:0]**. The number of instruction cache refills satisfied from the L2 cache. Each increment represents one 64 B cache line transfer.

**PMCx083 Instruction Cache Refills from System**

**PERF\_CTL[2:0].** The number of instruction cache refills from system memory (or another cache). Each increment represents one 64 B cache line transfer.

**PMCx084 L1 ITLB Miss, L2 ITLB Hit**

**PERF\_CTL[2:0].** The number of instruction fetches that miss in the L1 ITLB but hit in the L2 TLB

**PMCx085 L1 ITLB Miss, L2 ITLB Miss**

**PERF\_CTL[2:0].** The number of instruction fetches that miss in both the L1 and L2 TLBs.

| UnitMask | Description                         |
|----------|-------------------------------------|
| 7:3      | Reserved.                           |
| 2        | Instruction fetches to a 1 GB page. |
| 1        | Instruction fetches to a 2 MB page. |
| 0        | Instruction fetches to a 4 KB page. |

**PMCx086 Pipeline Restart Due to Instruction Stream Probe**

**PERF\_CTL[2:0].** The number of pipeline restarts caused by invalidating probes that hit on the instruction stream currently being executed. This would happen if the active instruction stream was being modified by another processor in an MP system - typically a highly unlikely event.

**PMCx087 Instruction Fetch Stall**

**PERF\_CTL[2:0].** The number of cycles the instruction fetcher is stalled for the core. This may be for a variety of reasons such as branch predictor updates, unconditional branch bubbles, far jumps and cache misses, instruction fetching for the other core while instruction fetch for this core is stalled, among others. May be overlapped by instruction dispatch stalls or instruction execution, such that these stalls don't necessarily impact performance.

**PMCx088 Return Stack Hits**

**PERF\_CTL[2:0].** The number of near return instructions (RET or RET Iw) that get their return address from the return address stack (i.e. where the stack has not gone empty) for the core. This may include cases where the address is incorrect (return mispredicts). This may also include speculatively executed false-path returns. Return mispredicts are typically caused by the return address stack underflowing, however they may also be caused by an imbalance in calls vs. returns, such as doing a call but then popping the return address off the stack.

This event cannot be reliably compared with events C9h and CAh (such as to calculate percentage of return mispredicts due to an empty return address stack), since it may include speculatively executed false-path returns that are not included in those retire-time events.

**PMCx089 Return Stack Overflows**

[PERF\\_CTL\[2:0\]](#). The number of (near) call instructions that cause the return address stack to overflow. When this happens, the oldest entry is discarded. This count may include speculatively executed calls.

**PMCx08B Instruction Cache Victims**

[PERF\\_CTL\[2:0\]](#). The number of cachelines evicted from the instruction cache to the L2. This event is not core specific and for either core counts the IC victims caused by both cores of the compute unit.

**PMCx08C Instruction Cache Lines Invalidated**

[PERF\\_CTL\[2:0\]](#). The number of instruction cache lines invalidated. A non-SMC event is CMC (cross modifying code), either from the other core of the compute unit or another compute compute unit.

| UnitMask | Description   |
|----------|---|
| 7:4      | Reserved.   |
| 3        | SMC invalidating probe that hit on in-flight instructions.        |
| 2        | SMC invalidating probe that missed on in-flight instructions.     |
| 1        | Non-SMC invalidating probe that hit on in-flight instructions.    |
| 0        | Non-SMC invalidating probe that missed on in-flight instructions. |

**PMCx099 ITLB Reloads**

[PERF\\_CTL\[2:0\]](#). The number of ITLB reload requests.

**PMCx09A ITLB Reloads Aborted**

[PERF\\_CTL\[2:0\]](#). The number of ITLB reloads aborted.

**3.15.6 PMCx0[BF:A0] Events**

There are no PMCx0[BF:A0] Events.

**3.15.7 PMCx[1,0][DF:C0] Events (EX, DE)****PMCx0C0 Retired Instructions**

[PERF\\_CTL\[5:0\]](#). The number of instructions retired (execution completed and architectural state updated). This count includes exceptions and interrupts - each exception or interrupt is counted as one instruction.

**PMCx0C1 Retired uops**

[PERF\\_CTL\[5:0\]](#). The number of micro-ops retired. This includes all processor activity (instructions, exceptions, interrupts, microcode assists, etc.). The number of events logged per cycle can vary from 0 to 4.

**PMCx0C2 Retired Branch Instructions**

---

[PERF\\_CTL\[5:0\]](#). The number of branch instructions retired. This includes all types of architectural control flow changes, including exceptions and interrupts.

**PMCx0C3 Retired Mispredicted Branch Instructions**

---

[PERF\\_CTL\[5:0\]](#). The number of branch instructions retired, of any type, that were not correctly predicted. This includes those for which prediction is not attempted (far control transfers, exceptions and interrupts).

**PMCx0C4 Retired Taken Branch Instructions**

---

[PERF\\_CTL\[5:0\]](#). The number of taken branches that were retired. This includes all types of architectural control flow changes, including exceptions and interrupts.

**PMCx0C5 Retired Taken Branch Instructions Mispredicted**

---

[PERF\\_CTL\[5:0\]](#). The number of retired taken branch instructions that were mispredicted.

**PMCx0C6 Retired Far Control Transfers**

---

[PERF\\_CTL\[5:0\]](#). The number of far control transfers retired including far call/jump/return, IRET, SYSCALL and SYSRET, plus exceptions and interrupts. Far control transfers are not subject to branch prediction.

**PMCx0C7 Retired Branch Resyncs**

---

[PERF\\_CTL\[5:0\]](#). The number of resync branches. These reflect pipeline restarts due to certain microcode assists and events such as writes to the active instruction stream, among other things. Each occurrence reflects a restart penalty similar to a branch mispredict. This is relatively rare.

**PMCx0C8 Retired Near Returns**

---

[PERF\\_CTL\[5:0\]](#). The number of near return instructions (RET or RET Iw) retired.

**PMCx0C9 Retired Near Returns Mispredicted**

---

[PERF\\_CTL\[5:0\]](#). The number of near returns retired that were not correctly predicted by the return address predictor. Each such mispredict incurs the same penalty as a mispredicted conditional branch instruction.

**PMCx0CA Retired Indirect Branches Mispredicted**

---

[PERF\\_CTL\[5:0\]](#). The number of indirect branch instructions retired where the target address was not correctly predicted.

**PMCx0CB Retired MMX/FP Instructions**

---

[PERF\\_CTL\[5:0\]](#). The number of MMX, SSE or x87 instructions retired. The UnitMask allows the selection of the individual classes of instructions as given in the table. Each increment represents one complete instruction. Since this event includes non-numeric instructions it is not suitable for measuring MFLOPS.

| UnitMask | Description  |
|----------|--|
| 7:3      | Reserved.  |
| 2        | SSE instructions (SSE, SSE2, SSE3, SSSE3, SSE4A, SSE4.1, SSE4.2, AVX, XOP, FMA4) |
| 1        | MMX™ instructions.   |
| 0        | x87 instructions.  |

### PMCx0CD Interrupts-Masked Cycles

**PERF\_CTL[5:0]**. The number of processor cycles where interrupts are masked (EFLAGS.IF = 0). Using edge-counting with this event gives the number of times IF is cleared; dividing the cycle-count value by this value gives the average length of time that interrupts are disabled on each instance. Compare the edge count with **PMCx0CF** to determine how often interrupts are disabled for interrupt handling vs. other reasons (e.g. critical sections).

### PMCx0CE Interrupts-Masked Cycles with Interrupt Pending

**PERF\_CTL[5:0]**. The number of processor cycles where interrupts are masked (EFLAGS.IF = 0) and an interrupt is pending. Using edge-counting with this event and comparing the resulting count with the edge count for **PMCx0CD** gives the proportion of interrupts for which handling is delayed due to prior interrupts being serviced, critical sections, etc. The cycle count value gives the total amount of time for such delays. The cycle count divided by the edge count gives the average length of each such delay.

### PMCx0CF Interrupts Taken

**PERF\_CTL[5:0]**. The number of hardware interrupts taken. This does not include software interrupts (INT n instruction).

### PMCx0D0 Decoder Empty

**PERF\_CTL[2:0]**. The number of processor cycles where the decoder has nothing to dispatch (typically waiting on an instruction fetch that missed the Icache, or for the target fetch after a branch mispredict).

### PMCx0D1 Dispatch Stalls

**PERF\_CTL[2:0]**. The number of processor cycles where the decoder is stalled for any reason (has one or more instructions ready but can't dispatch them due to resource limitations in execution). This event requires that the other core of the compute unit is in the Halt state. This is the combined effect of events **PMCx0D3** to **PMCx0D9**, some of which may overlap; this event reflects the net stall cycles. The more common stall conditions (events **PMCx0D5**, **PMCx0D6**, **PMCx0D7**, **PMCx0D8**) may overlap considerably. The occurrence of these stalls is highly dependent on the nature of the code being executed (instruction mix, memory reference patterns, etc.).

### PMCx0D3 Microsequencer Stall due to Serialization

**PERF\_CTL[2:0]**. The number of processor cycles the microsequencer is stalled due to a serializing operation, which waits for the execution pipeline to drain. Relatively rare; mainly associated with system instructions. See **PMCx0D1**.

**PMCx0D5 Dispatch Stall for Instruction Retire Q Full**

**PERF\_CTL[2:0]**. The number of processor cycles the decoder is stalled because the instruction retire Q is full. This event requires that the other core of the compute unit is in the Halt state. May occur simultaneously with certain other stall conditions; see [PMCx0D1](#).

**PMCx0D6 Dispatch Stall for Integer Scheduler Queue Full**

**PERF\_CTL[2:0]**. The number of processor cycles the decoder is stalled because a required integer unit scheduler queue is full. This event requires that the other core of the compute unit is in the Halt state. May occur simultaneously with certain other stall conditions; see [PMCx0D1](#).

**PMCx0D7 Dispatch Stall for FP Scheduler Queue Full**

**PERF\_CTL[2:0]**. The number of processor cycles the decoder is stalled because the scheduler for the Floating Point scheduler queue is full. This event requires that the other core of the compute unit is in the Halt state. This condition can be caused by a lack of parallelism in FP-intensive code, or by cache misses on FP operand loads (which could also show up as [PMCx0D8](#) instead, depending on the nature of the instruction sequences). May occur simultaneously with certain other stall conditions; see [PMCx0D1](#).

**PMCx0D8 Dispatch Stall for LDQ Full**

**PERF\_CTL[2:0]**. The number of processor cycles the decoder is stalled because the load queue is full. This event requires that the other core of the compute unit is in the Halt state. This generally occurs due to heavy cache miss activity. May occur simultaneously with certain other stall conditions; see [PMCx0D1](#).

**PMCx0D9 Microsequencer Stall Waiting for All Quiet**

**PERF\_CTL[2:0]**. The number of processor cycles the microsequencer is stalled waiting for all outstanding requests to the system to be resolved. Relatively rare; associated with certain system instructions and types of interrupts. May partially overlap certain other stall conditions; see [PMCx0D1](#).

**PMCx0DB FPU Exceptions**

**PERF\_CTL[5:0]**. The number of floating point unit exceptions for microcode assists. The UnitMask may be used to isolate specific types of exceptions.

| UnitMask | Description       |
|----------|-------------------|
| 7:5      | Reserved.         |
| 4        | Bypass faults     |
| 3        | Ext2Int faults    |
| 2        | Int2Ext faults    |
| 1        | Total microtraps  |
| 0        | Total microfaults |

### PMCx0D[F:C] DR[3:0] Breakpoint Matches

Table 299: Register Mapping for PMCx0D[F:C]

| Register | Function |
|----------|----------|
| PMCx0DC  | DR0      |
| PMCx0DD  | DR1      |
| PMCx0DE  | DR2      |
| PMCx0DF  | DR3      |

**PERF\_CTL[5:0]**. The number of matches on the address in breakpoint register DR[3:0], per the breakpoint type specified in DR7.

Data matches:

- Data matches are counted if the breakpoint is enabled and the data access becomes non-speculative, but not necessarily retired.
- Load/store breakpoint matches do not incur any overhead.

Instruction matches:

- Instruction matches becomes non-speculative, but not necessarily retired. Instruction matches do not depend on the breakpoint being enabled.
- Each instruction breakpoint match incurs an overhead of about 120 cycles

### PMCx1CF Tagged IBS Ops

**PERF\_CTL[5:0]**.

| UnitMask | Description  |
|----------|--|
| 7:3      | Reserved.  |
| 2        | Number of times an op could not be tagged by IBS because of a previous tagged op that has not retired. |
| 1        | Number of ops tagged by IBS that retired.  |
| 0        | Number of ops tagged by IBS.   |

### PMCx1D8 Dispatch Stall for STQ Full

**PERF\_CTL[5:0]**. The number of processor cycles the decoder is stalled because the store queue is full. This event requires that the other core of the compute unit is in the Halt state. This generally occurs due to heavy cache miss activity. May occur simultaneously with certain other stall conditions.

## 3.16 NB Performance Counter Events

This section provides the performance counter events that may be selected through **MSRC001\_024[6,4,2,0]** [Northbridge Performance Event Select (NB\_PERF\_CTL[3:0])][EventSelect and UnitMask]. See that register and **MSRC001\_024[7,5,3,1]** [Northbridge Performance Event Counter (NB\_PERF\_CTR[3:0])].

### 3.16.1 NBPMCx0E[7:0] Events (Memory Controller)

#### NBPMCx0E0 DRAM Accesses

The number of memory accesses performed by the local DRAM controller. UnitMask[7:0] may be used to isolate the different DRAM page access cases. Page miss cases incur an extra latency to open a page; page conflict cases incur both a page-close as well as page-open penalties. These penalties may be overlapped by DRAM accesses for other requests and don't necessarily represent lost DRAM bandwidth. The associated penalties are as follows:

Page miss: Trcd (DRAM RAS-to-CAS delay)  
 Page conflict: Trp + Trcd (DRAM row-precharge time plus RAS-to-CAS delay)

Each DRAM access represents one 64-byte block of data transferred if the DRAM is configured for 64-byte granularity, or one 32-byte block if the DRAM is configured for 32-byte granularity. (The latter is only applicable to single-channel DRAM systems, which may be configured either way.)

| UnitMask | Description        |
|----------|--------------------|
| 7:6      | Reserved.          |
| 5        | DCT1 Page Conflict |
| 4        | DCT1 Page Miss     |
| 3        | DCT1 Page hit      |
| 2        | DCT0 Page Conflict |
| 1        | DCT0 Page Miss     |
| 0        | DCT0 Page hit      |

#### NBPMCx0E1 DRAM Controller Page Table Overflows

The number of page table overflows in the local DRAM controller. This table maintains information about which DRAM pages are open. An overflow occurs when a request for a new page arrives when the maximum number of pages are already open. Each occurrence reflects an access latency penalty equivalent to a page conflict.

| UnitMask | Description              |
|----------|--------------------------|
| 7:2      | Reserved.                |
| 1        | DCT1 Page Table Overflow |
| 0        | DCT0 Page Table Overflow |

#### NBPMCx0E2 Memory Controller DRAM Command Slots Missed

| UnitMask | Description                            |
|----------|--|
| 7:2      | Reserved.                              |
| 1        | DCT1 Command Slots Missed (in MemClks) |
| 0        | DCT0 Command Slots Missed (in MemClks) |

### NBPMCx0E3 Memory Controller Turnarounds

The number of turnarounds on the local DRAM data bus. UnitMask[7:0] may be used to isolate the different cases. These represent lost DRAM bandwidth, which may be calculated as follows (in bytes per occurrence):

DIMM turnaround:  $\text{DRAM\_width\_in\_bytes} * 2 \text{ edges\_per\_memclk} * 2$   
 R/W turnaround:  $\text{DRAM\_width\_in\_bytes} * 2 \text{ edges\_per\_memclk} * 1$   
 R/W turnaround:  $\text{DRAM\_width\_in\_bytes} * 2 \text{ edges\_per\_memclk} * (\text{Tcl}-1)$

where DRAM\_width\_in\_bytes is 8 or 16 (for single- or dual-channel systems), and Tcl is the CAS latency of the DRAM in memory system clock cycles (where the memory clock for DDR-400, or PC3200 DIMMS, for example, would be 200 MHz).

| UnitMask | Description                        |
|----------|------------------------------------|
| 7:6      | Reserved.                          |
| 5        | DCT1 Write to read turnaround      |
| 4        | DCT1 Read to write turnaround      |
| 3        | DCT1 DIMM (chip select) turnaround |
| 2        | DCT0 Write to read turnaround      |
| 1        | DCT0 Read to write turnaround      |
| 0        | DCT0 DIMM (chip select) turnaround |

### NBPMCx0E4 Memory Controller Bypass Counter Saturation

| UnitMask | Description                              |
|----------|--|
| 7:4      | Reserved.                                |
| 3        | DCT1 DCQ bypass                          |
| 2        | DCT0 DCQ bypass                          |
| 1        | Memory controller medium priority bypass |
| 0        | Memory controller high priority bypass   |

### 3.16.2 NBPMCx0E[F:8] Events (Crossbar)

#### NBPMCx0E8 Thermal Status

| UnitMask | Description                              |
|----------|--|
| 7        | Reserved                                 |
| 6        | Number of clocks HTC P-state is active   |
| 5        | Number of clocks HTC P-state is inactive |
| 4        | Reserved.                                |
| 3        | Reserved.                                |

|     |   |
|-----|---|
| 2   | Number of times the HTC trip point is crossed |
| 1:0 | Reserved                                      |

### NBPMCx0E9 CPU/IO Requests to Memory/IO

These events reflect request flow between units and nodes, as selected by the UnitMask. The UnitMask is divided into two fields: request type (CPU or IO access to IO or Memory) and source/target location (local vs. remote). One or more requests types must be enabled via bits 3:0, and at least one source and one target location must be selected via bits 7:4. Each event reflects a request of the selected type(s) going from the selected source(s) to the selected target(s).

Not all possible paths are supported. The following table shows the UnitMask values that are valid for each request type:

| Source/Target    | CPU to Mem | CPU to IO | IO to Mem | IO to IO |
|------------------|------------|-----------|-----------|----------|
| Local -> Local   | A8h        | A4h       | A2h       | A1h      |
| Local -> Remote  | 98h        | 94h       | 92h       | 91h      |
| Remote -> Local  | -          | 64h       | -         | 61h      |
| Remote -> Remote | -          | -         | -         | -        |

Any of the mask values shown may be logically ORed to combine the events. For instance, local CPU requests to both local and remote nodes would be  $A8h \mid 98h = B8h$ . Any CPU to any IO would be  $A4h \mid 94h \mid 64h = F4h$  (but remote CPU to remote IO requests would not be included).

Note: It is not possible to tell from these events how much data is going in which direction, as there is no distinction between reads and writes. Also, particularly for IO, the requests may be for varying amounts of data, anywhere from one to sixty-four bytes. For a direct measure of the amount and direction of data flowing between nodes, use events F6h, F7h and F8h.

| UnitMask | Description      |
|----------|------------------|
| 7        | From local node  |
| 6        | From remote node |
| 5        | To local node    |
| 4        | To remote node   |
| 3        | CPU to Mem       |
| 2        | CPU to IO        |
| 1        | IO to Mem        |
| 0        | IO to IO         |

### NBPMCx0EA Cache Block Commands

The number of requests made to the system for cache line transfers or coherency state changes, by request type. Each increment represents one cache line transfer, except for Change-to-Dirty. If a Change-to-Dirty request hits on a line in another processor's cache that's in the Owned state, it causes a cache line transfer, otherwise there is no data transfer associated with Change-to-Dirty requests.

| UnitMask | Description   |
|----------|---|
| 7:6      | Reserved.   |
| 5        | Change-to-Dirty (first store to clean block already in cache) |
| 4        | Read Block Modified (Dcache store miss refill)                |
| 3        | Read Block Shared (Icache refill)                             |
| 2        | Read Block (Dcache load miss refill)                          |
| 1        | Reserved.   |
| 0        | Victim Block (Writeback)                                      |

### NBPMCx0EB Sized Commands

The number of Sized Read/Write commands handled by the System Request Interface (local processor and hostbridge interface to the system). These commands may originate from the processor or hostbridge. Typical uses of the various Sized Read/Write commands are given in the UnitMask table. See [NBPMCx0EC](#), which provides a separate measure of Hostbridge accesses.

| UnitMask | Description  |
|----------|--|
| 7:6      | Reserved.  |
| 5        | SzRd DW (1-16 dwords). Typical Usage: Block-oriented DMA reads, typically cache-line size.   |
| 4        | SzRd Byte (4 bytes). Typical Usage: Legacy or mapped IO.   |
| 3        | Posted SzWr DW (1-16 dwords). Typical Usage: Block-oriented DMA writes, often cache-line sized; also processor Write Combining buffer flushes. |
| 2        | Posted SzWr Byte (1-32 bytes). Typical Usage: Subcache-line DMA writes, size varies; also flushes of partially-filled Write Combining buffer.  |
| 1        | Non-Posted SzWr DW (1-16 dwords). Typical Usage: Legacy or mapped IO, typically 1 DWORD.   |
| 0        | Non-Posted SzWr Byte (1-32 bytes). Typical Usage: Legacy or mapped IO, typically 1-4 bytes.  |

### NBPMCx0EC Probe Responses and Upstream Requests

This covers two unrelated sets of events: cache probe results, and requests received by the hostbridge from devices on non-coherent links.

**Probe results:** These events reflect the results of probes sent from a memory controller to local caches. They provide an indication of the degree data and code is shared between processors (or moved between processors due to process migration). The dirty-hit events indicate the transfer of a 64-byte cache line to the requestor (for a read or cache refill) or the target memory (for a write). The system bandwidth used by these, in terms of bytes per unit of time, may be calculated as 64 times the event count, divided by the elapsed time. Sized writes to memory that cover a full cache line do not incur this cache line transfer -- they simply invalidate the line and are reported as clean hits. Cache line transfers occur for Change2Dirty requests that hit cache lines in the Owned state. (Such cache lines are counted as Modified-state refills for [PMCx06C](#), System Read Responses.)

**Upstream requests:** The upstream read and write events reflect requests originating from a device on a local IO link. The two read events allow display refresh traffic in a UMA system to be measured separately from other DMA activity. Display refresh traffic is typically dominated by 64-byte transfers. Non-display-related DMA accesses may be anywhere from 1 to 64 bytes in size, but may be dominated by a particular size such as

32 or 64 bytes, depending on the nature of the devices.

| UnitMask | Description   |
|----------|---|
| 7        | Upstream non-ISOC writes  |
| 6        | Upstream ISOC writes  |
| 5        | Upstream non-display refresh reads  |
| 4        | Upstream display refresh/ISOC reads   |
| 3        | Probe hit dirty with memory cancel (probed by DMA read or cache refill request) |
| 2        | Probe hit dirty without memory cancel (probed by Sized Write or Change2Dirty)   |
| 1        | Probe hit clean   |
| 0        | Probe miss  |

### NBPMCx0EE GART Events

These events reflect GART activity, and in particular allow one to calculate the GART TLB miss ratio as GART\_miss\_count divided by GART\_aperture\_hit\_count. GART aperture accesses are typically from IO devices as opposed to the processor, and generally from a 3D graphics accelerator, but can be from other devices when the GART is used as an IOMMU.

| UnitMask | Description                             |
|----------|---|
| 7        | GART multiple table walk in progress    |
| 6:4      | Reserved.                               |
| 3        | GART Request hit table walk in progress |
| 2        | GART miss                               |
| 1        | GART aperture hit on access from IO     |
| 0        | GART aperture hit on access from CPU    |

### 3.16.3 NBPMCx0F[F:0] Events (Link, Crossbar)

#### NBPMCx[1F9,0F8,0F7,0F6] Link Transmit Bandwidth

Table 300: [Register Mapping](#) for NBPMCx[1F9,0F8,0F7,0F6]

| Register  | Function |
|-----------|----------|
| NBPMCx0F6 | Link 0   |
| NBPMCx0F7 | Link 1   |
| NBPMCx0F8 | Link 2   |
| NBPMCx1F9 | Link 3   |

The number of DWs transmitted (or unused, in the case of NOPs) on the outgoing side of the links. The count for (UnitMask[7:0]==3Fh) is the maximum transmission rate of the link. Link utilization may be calculated by (The count for (UnitMask[7:0]==37h))/(The count for (UnitMask[7:0]==3Fh)), described as non-NOP traffic divided by total traffic. Bandwidth in terms of bytes per unit time for any one component or combination of components is calculated by multiplying the count by four and dividing by elapsed time. The Data event provides a direct indication of the flow of data around the system. Translating this link-based view into a

source/target node based view requires knowledge of the system layout (i.e. which links connect to which nodes).

| UnitMask | Description   |
|----------|---|
| 7        | <b>SubLinkMask: sublink select.</b> Sublink select if link is unganged; reserved if ganged. 0=Sublink 0. 1=Sublink 1. |
| 6        | Reserved.   |
| 5        | Per packet CRC sent   |
| 4        | Address (including extensions) DW sent  |
| 3        | NOP DW sent (idle)  |
| 2        | Buffer release DW sent  |
| 1        | Data DW sent  |
| 0        | Command DW sent   |

### 3.16.4 NBPMCx1E[F:0] Events (Crossbar)

#### NBPMCx1E0 CPU to DRAM Requests to Target Node

This event counts all DRAM reads and writes generated by cores on the local node to the targeted node in the coherent fabric. This counter can be used to observe processor data affinity in NUMA aware operating systems.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 7 |
| 6        | From Local node to Node 6 |
| 5        | From Local node to Node 5 |
| 4        | From Local node to Node 4 |
| 3        | From Local node to Node 3 |
| 2        | From Local node to Node 2 |
| 1        | From Local node to Node 1 |
| 0        | From Local node to Node 0 |

#### NBPMCx1E1 IO to DRAM Requests to Target Node

This event counts all DRAM reads and writes generated by IO devices attached to the IO links of the local node the targeted node in the coherent fabric. This counter can be used to observe IO device data affinity in NUMA aware operating systems.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 7 |
| 6        | From Local node to Node 6 |
| 5        | From Local node to Node 5 |
| 4        | From Local node to Node 4 |
| 3        | From Local node to Node 3 |

|   |                           |
|---|---------------------------|
| 2 | From Local node to Node 2 |
| 1 | From Local node to Node 1 |
| 0 | From Local node to Node 0 |

### **NBPMCx1E2 CPU Read Command Latency to Target Node 0-3**

This event counts the number of NB clocks from when the targeted command is received in the NB to when the targeted command completes. This event only tracks one outstanding command at a time. To determine latency between the local node and a remote node set UnitMask[7:4] to select the node and UnitMask[3:0] to select the read command type. The count returned by the counter should be divided by the count returned by [NBPMCx1E3](#) to determine the average latency for the command type.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 3 |
| 6        | From Local node to Node 2 |
| 5        | From Local node to Node 1 |
| 4        | From Local node to Node 0 |
| 3        | Change-to-Dirty           |
| 2        | Read block modified       |
| 1        | Read block shared         |
| 0        | Read block                |

### **NBPMCx1E3 CPU Read Command Requests to Target Node 0-3**

This event counts the number of requests that a latency measurement is made for using [NBPMCx1E2](#). To determine the number of commands that a latency measurement are made for between the local node and a remote node set UnitMask[7:4] to select the node and UnitMask[3:0] to select the read command type.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 3 |
| 6        | From Local node to Node 2 |
| 5        | From Local node to Node 1 |
| 4        | From Local node to Node 0 |
| 3        | Change-to-Dirty           |
| 2        | Read block modified       |
| 1        | Read block shared         |
| 0        | Read block                |

### **NBPMCx1E4 CPU Read Command Latency to Target Node 4-7**

This event counts the number of NB clocks from when the targeted command is received in the NB to when the targeted command completes. This event only tracks one outstanding command at a time. To determine latency between the local node and a remote node set UnitMask[7:4] to select the node and UnitMask[3:0] to select the read command type. The count returned by the counter should be divided by the count returned by [NBPMCx1E5](#) to determine the average latency for the command type.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 7 |
| 6        | From Local node to Node 6 |
| 5        | From Local node to Node 5 |
| 4        | From Local node to Node 4 |
| 3        | Change-to-Dirty           |
| 2        | Read block modified       |
| 1        | Read block shared         |
| 0        | Read block                |

#### **NBPMCx1E5 CPU Read Command Requests to Target Node 4-7**

This event counts the number of requests that a latency measurement is made for using [NBPMCx1E4](#). To determine the number of commands that a latency measurement are made for between the local node and a remote node set UnitMask[7:4] to select the node and UnitMask[3:0] to select the read command type.

| UnitMask | Description               |
|----------|---------------------------|
| 7        | From Local node to Node 7 |
| 6        | From Local node to Node 6 |
| 5        | From Local node to Node 5 |
| 4        | From Local node to Node 4 |
| 3        | Change-to-Dirty           |
| 2        | Read block modified       |
| 1        | Read block shared         |
| 0        | Read block                |

#### **NBPMCx1E6 CPU Command Latency to Target Node 0-3/4-7**

This event counts the number of NB clocks from when the targeted command is received in the NB to when the targeted command completes. This event only tracks one outstanding command at a time. To determine latency between the local node and a remote node set UnitMask[7:4] to select the node, UnitMask[3] to select the node group and UnitMask[3:0] to select the command type. The count returned by the counter should be divided by the count returned by [NBPMCx1E7](#) to determine the average latency for the command type.

| UnitMask | Description                                   |
|----------|---|
| 7        | From Local node to Node 3/7                   |
| 6        | From Local node to Node 2/6                   |
| 5        | From Local node to Node 1/5                   |
| 4        | From Local node to Node 0/4                   |
| 3        | Node Group Select. 0=Nodes 0-3. 1= Nodes 4-7. |
| 2        | Victim Block                                  |
| 1        | Write Sized                                   |
| 0        | Read Sized                                    |

**NBPMCx1E7 CPU Requests to Target Node 0-3/4-7**

This event counts the number of requests that a latency measurement is made for using [NBPMCx1E6](#). To determine the number of commands that a latency measurement are made for between the local node and a remote node set UnitMask[7:4] to select the node, UnitMask[3] to select the node group and UnitMask[3:0] to select the command type.

| UnitMask | Description                                   |
|----------|---|
| 7        | From Local node to Node 3/7                   |
| 6        | From Local node to Node 2/6                   |
| 5        | From Local node to Node 1/5                   |
| 4        | From Local node to Node 0/4                   |
| 3        | Node Group Select. 0=Nodes 0-3. 1= Nodes 4-7. |
| 2        | Victim Block                                  |
| 1        | Write Sized                                   |
| 0        | Read Sized                                    |

**NBPMCx1EA Request Cache Status 0**

The probe response type for RdBlk or RdBlkS request type. [D18F0x68](#)[ATMMModeEn]=1 is required for this event.

| UnitMask | Description                 |
|----------|-----------------------------|
| 7        | Track Cache Stat for RdBlkS |
| 6        | Track Cache Stat for RdBlk  |
| 5        | Directed Probe              |
| 4        | Probe Miss                  |
| 3        | Probe Hit M                 |
| 2        | Probe Hit MuW or O          |
| 1        | Probe Hit E                 |
| 0        | Probe Hit S                 |

**NBPMCx1EB Request Cache Status 1**

The probe response type for RdBlkM or ChgToDirty request type.

| UnitMask | Description                     |
|----------|---------------------------------|
| 7        | Track Cache Stat for RdBlkM     |
| 6        | Track Cache Stat for ChgToDirty |
| 5        | Directed Probe                  |
| 4        | Probe Miss                      |
| 3        | Probe Hit M                     |
| 2        | Probe Hit MuW or O              |

|   |             |
|---|-------------|
| 1 | Probe Hit E |
| 0 | Probe Hit S |

### 3.16.5 NBPMCx1F[F:0] Events (Memory Controller, Crossbar)

#### NBPMCx1F0 Memory Controller Requests

Read/Write requests: The read/write request events reflect the total number of commands sent to the DRAM controller.

Sized Read/Write activity: The Sized Read/Write events reflect 32- or 64-byte transfers (as opposed to other sizes which could be anywhere between 1 and 64 bytes), from either the processor or the Hostbridge (on any node in an MP system). Such accesses from the processor would be due only to write combining buffer flushes, where 32-byte accesses would reflect flushes of partially-filled buffers. [PMCx065](#) provides a count of sized write requests associated with WC buffer flushes; comparing that with counts for these events (providing there is very little Hostbridge activity at the same time) gives an indication of how efficiently the write combining buffers are being used. [PMCx065](#) may also be useful in factoring out WC flushes when comparing these events with the Upstream Requests component of [PMCx06C](#).

| UnitMask | Description  |
|----------|--|
| 7        | Read requests sent to the DCT while writes requests are pending in the DCT |
| 6        | 64 Byte Sized Reads  |
| 5        | 32 Bytes Sized Reads   |
| 4        | 64 Bytes Sized Writes  |
| 3        | 32 Bytes Sized Writes  |
| 2        | Prefetch requests sent to the DCT  |
| 1        | Read requests (including prefetch requests) sent to the DCT                |
| 0        | Write requests sent to the DCT   |

NBPMCx1F9: See [NBPMCx\[1F9,0F8,0F7,0F6\]](#) [[Link Transmit Bandwidth](#)].

### 3.16.6 NBPMCx[5F:4E][F:0] Events (L3 Cache)

#### NBPMCx4E0 Read Request to L3 Cache

This event counts the read requests from each core to the L3 cache including canceled requests.

| UnitMask | Description  |      |             |    |        |       |                |    |        |       |          |    |           |
|----------|--|------|-------------|----|--------|-------|----------------|----|--------|-------|----------|----|-----------|

### NBPMCx4EF L3 Latency

This event enables the average latency for L3 requests to be calculated (L3CycCount/L3ReqCount).

| UnitMask | Description                                |
|----------|--|
| 7:2      | Reserved.                                  |
| 1        | <b>L3ReqCount.</b> L3 request count.       |
| 0        | <b>L3CycCount.</b> L3 Request cycle count. |

## 4 Register List

The following is a list of all storage elements, context, and registers provided in this document. Page numbers, register mnemonics, and register names are provided.

|     |  |     |  |
|-----|--|-----|--|
| 54  | SMMFEC0: SMM IO Trap Offset                            | 178 | F2RC2: DDR3 Buffer Function 2 Control Word 2                                       |
| 54  | SMMFEC4: Local SMI Status                              | 178 | F2RC3: DDR3 Buffer Function 2 Control Word 3                                       |
| 55  | SMMFEC8: SMM IO Restart Byte                           | 178 | F2RC[15:8,6:4]: DDR3 Buffer Function 2 Control Word [15:8,6:4]                     |
| 55  | SMMFEC9: Auto Halt Restart Offset                      | 179 | F3RC0: DDR3 Buffer Function 3 Control Word 0                                       |
| 56  | SMMFECA: NMI Mask                                      | 179 | F3RC1: DDR3 Buffer Function 3 Control Word 1                                       |
| 56  | SMMFED8: SMM SVM State                                 | 179 | F3RC2: DDR3 Buffer Function 3 Control Word 2                                       |
